Chapter 1

JSON2Batch

This file is autogenerated. Changes will be overwritten

1.1 JSON2Batch

Todo Update README.md

Beschreibung: A simple tool to convert json to batch.

Version: 0.2.1

Authoren: Elena Schwarzbach, Max Rodler, Simon Blum, Sonia Sinaci

Documentation: `https://definitelynotsimon13.github.io/ProjectJsonToBat`

Aktueller Plan:

- Verantworlichkeiten zugewiesen
- "Sprint" bis ?

Verantwortlichkeiten:

- `CMake` &#8594 Simon
- `JsonParsing` &#8594 Elena und Sonia
- `Batch Creation` &#8594 Max
- `CLI` &#8594 Simon

Andere Arbeitspakete

- Error Handling
- Unit Tests
- Code Quality
- Documentation

Bezüglich Code Quality

- Kein using namespace

- Nur main im Global Namespace

Wichtige Commands

Branch wechseln

- git checkout -b NEUERBRANCH Pushen
- git push origin zum pullen
- git pull –prune

Kurze Doxygen Übersicht

Chapter 8

Topic Documentation

8.1 StyleHelpers

Static variables to help with CLI styling.

Static variables to help with CLI styling.

A group of strings, that use escape sequences to easily style the command line interface on Unix systems. When compiling for Windows all of these strings will be empty, as escape sequences can't be used the same way.

Chapter 9

Namespace Documentation

9.1 cli Namespace Reference

Includes everything regarding the CLI.

Classes

- class CommandLineHandler

  Responsible for the Command Line Interface.

Variables

- static const struct option options [ ]

9.1.1 Detailed Description

Includes everything regarding the CLI.

This namespace includes all the code regarding the Command Line Interface. This includes the CommandLineHandler Class, the struct for the options and helpers for Styling.

CommandLineHandler

options

StyleHelpers

9.1.2 Variable Documentation

9.1.2.1 options

```
const struct option cli::options[]  [static]
```

Initial value:

```
= {
    {"help", no_argument, nullptr, 'h'},
    {"version", no_argument, nullptr, 'v'},
    {"credits", no_argument, nullptr, 'c'},
    {"verbose", no_argument, nullptr, 0},
    {"outdir", required_argument, nullptr, 'o'},
    nullptr

}
```

Definition at line 117 of file CommandLineHandler.hpp.

9.2 exceptions Namespace Reference

Namespace used for customized exceptions.

Classes

- class CustomException

  Base class for all custom exceptions.
- class FailedToOpenFileException
- class FileExistsException

  Exception for an already exisiting outputfile.
- class InvalidKeyException

  Exception for invalid keys.
- class InvalidTypeException

  Exception for invalid types.
- class InvalidValueException

  Exception for an ivalid (usually empty) value field.
- class MissingKeyException

  Exception for missing keys within entries.
- class MissingTypeException

  Exception for missing types of entries.
- class NoSuchDirException
- class ParsingException

  Exception for syntax errors within the json file.
- class UnreachableCodeException

  Exception for when the application reaches code it shouldn't reach.

9.2.1 Detailed Description

Namespace used for customized exceptions.

9.3 parsing Namespace Reference

The namespace containing everything relevant to parsing.

Classes

- class FileData

  This class contains all data from the json file.
- class JsonHandler

  This file reads all data from the json file.
- class KeyValidator

  Validates keys of a Json::Value object.

9.3.1 Detailed Description

The namespace containing everything relevant to parsing.

This namespace contains all relevant classes to parsing the json file and creating the batch output.

See also

JsonHandler

FileData

KeyValidator

BatchCreator

9.4 utilities Namespace Reference

Includes all utilities.

Classes

- class Utils

  Responsible for utility function.

9.4.1 Detailed Description

Includes all utilities.

This namespace includes the utility class with utility functions which can be used throughout the project.

See also

Utils

Chapter 10

Class Documentation

10.1 BatchCreator Class Reference

Erstellt Batch Datei.

`#include <BatchCreator.hpp>`

Public Member Functions

- BatchCreator (std::shared_ptr< parsing::FileData > fileData)
  Initialisiert BatchCreator.
- std::shared_ptr< std::stringstream > getDataStream ()

Private Member Functions

- void createBatch ()
  Setzt batch Datei zusammen.
- void writeStart ()
  Anfang der Batch Datei.
- void writeHideShell ()
  Sichtbarkeit Konsole.
- void writeCommands ()
  Befehle ausführen.
- void writeEnvVariables ()
  Umgebungsvariablen setzten.
- void writePathVariables ()
  Pfade setzten.
- void writeApp ()
  Öffnet Anwednung falls gewünscht.
- void writeEnd ()
  Ende der Batch Datei.

Private Attributes

- std::shared_ptr< std::stringstream > dataStream
- std::shared_ptr< parsing::FileData > fileData

10.1.1 Detailed Description

Erstellt Batch Datei.

Wandelt Elemente aus JSON-Datei in Batch-Format um

10.1.2 Constructor & Destructor Documentation

10.1.2.1 BatchCreator()

```
BatchCreator::BatchCreator (
            std::shared_ptr< parsing::FileData > fileData )
```

Initialisiert BatchCreator.

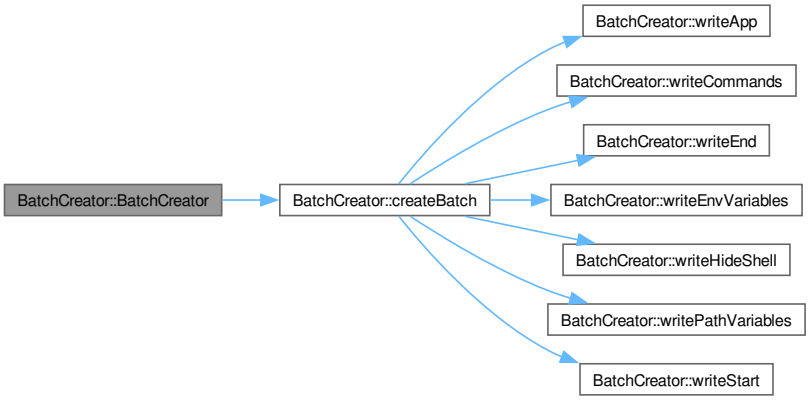
Parameters

filename	

Definition at line 16 of file BatchCreator.cpp.

References createBatch(), dataStream, and fileData.

Here is the call graph for this function:



10.1.3 Member Function Documentation

10.1.3.1 createBatch()

```
void BatchCreator::createBatch ( )  [private]
```

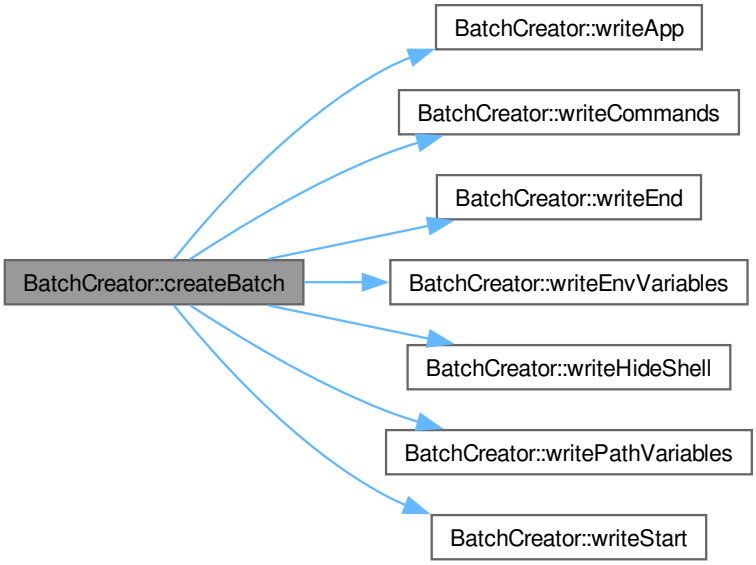
Setzt batch Datei zusammen.

Beinhaltet Aufrufe der einzelnen Komponenten der batch Datei

Definition at line 23 of file BatchCreator.cpp.

References writeApp(), writeCommands(), writeEnd(), writeEnvVariables(), writeHideShell(), writePathVariables(), and writeStart().

Here is the call graph for this function:



Here is the caller graph for this function:

10.1.3.2 getDataStream()

```
std::shared_ptr< std::stringstream > BatchCreator::getDataStream ( )  [inline]
```

Todo Documentation

Definition at line 37 of file BatchCreator.hpp.

References dataStream.

Here is the caller graph for this function:

10.1.3.3 writeApp()

```
void BatchCreator::writeApp ( )  [private]
```

Öffnet Anwednung falls gewünscht.

Öffnet Anwedung, falls unter "application" gegeben Wird unter dem Namen aus "outputfile" gestartet

Definition at line 76 of file BatchCreator.cpp.

References dataStream, and fileData.

Here is the caller graph for this function:

10.1.3.4 writeCommands()

```
void BatchCreator::writeCommands ( )  [private]
```

Befehle ausführen.

Führt Befehle aus: Zu finden unter "EXE" als "command"

Definition at line 51 of file BatchCreator.cpp.

References dataStream, and fileData.

Here is the caller graph for this function:

10.1.3.5 writeEnd()

```
void BatchCreator::writeEnd ( )  [private]
```

Ende der Batch Datei.

Schreibt den teil der Batch Datei der immer gleich ist

- setzt ECHO OFF

Definition at line 89 of file BatchCreator.cpp.

References dataStream.

Here is the caller graph for this function:

10.1.3.6 writeEnvVariables()

```
void BatchCreator::writeEnvVariables ( )  [private]
```

Umgebungsvariablen setzten.

Setzt Umgebungsvariablen aus "ENV" nach folgender Syntax: Eintrag unter "key" = Eintrag unter "value"

Definition at line 59 of file BatchCreator.cpp.

References dataStream, and fileData.

Here is the caller graph for this function:

10.1.3.7 writeHideShell()

```
void BatchCreator::writeHideShell ( )  [private]
```

Sichtbarkeit Konsole.

Zeigt bzw. versteckt Konsolenausgabe

Definition at line 40 of file BatchCreator.cpp.

References dataStream, and fileData.

Here is the caller graph for this function:

10.1.3.8 writePathVariables()

```
void BatchCreator::writePathVariables ( )  [private]
```

Pfade setzten.

Verknüpft die unter "PATH" angegebenen Pfade mit dem Systempfad Setzt Pfad

Definition at line 67 of file BatchCreator.cpp.

References dataStream, and fileData.

Here is the caller graph for this function:

10.1.3.9 writeStart()

```
void BatchCreator::writeStart ( )  [private]
```

Anfang der Batch Datei.

Schreibt den Teil der Batch Datei der immer gleich ist.

- setzt ECHO off
- startet cmd.exe

Definition at line 35 of file BatchCreator.cpp.

References dataStream.

Here is the caller graph for this function:

10.1.4 Member Data Documentation

10.1.4.1 dataStream

```
std::shared_ptr<std::stringstream> BatchCreator::dataStream  [private]
```

Definition at line 42 of file BatchCreator.hpp.

10.1.4.2 fileData

```
std::shared_ptr<parsing::FileData> BatchCreator::fileData  [private]
```

Definition at line 44 of file BatchCreator.hpp.

The documentation for this class was generated from the following files:

- src/include/BatchCreator.hpp
- src/sources/BatchCreator.cpp

10.2 cli::CommandLineHandler Class Reference

Responsible for the Command Line Interface.

```
#include <CommandLineHandler.hpp>
```

Public Member Functions

- CommandLineHandler ()=delete

  The Constructor of the CommandLineHandler Class.
- ~CommandLineHandler ()=delete

  The Destructor of the CommandLineHandler Class.

Static Public Member Functions

- static void printHelp ()

  Prints the help message.
- static void printVersion ()

  Prints the version message.
- static void printCredits ()

  Prints the credits message.
- static std::tuple< std::optional< std::string >, std::vector< std::string > > parseArguments (int argc, char *argv[])

  Parses the Command Line Arguments.

10.2.1 Detailed Description

Responsible for the Command Line Interface.

This class is responsible for parsing the command line arguments, printing Help/Version/Credits messages and returning inputted files.

Author

Simon Blum

Date

2024-04-18

Version

0.1.5

See also

options

Definition at line 53 of file CommandLineHandler.hpp.

10.2.2 Constructor & Destructor Documentation

10.2.2.1 CommandLineHandler()

```
cli::CommandLineHandler::CommandLineHandler ( )  [delete]
```

The Constructor of the CommandLineHandler Class.

Note

As all functions are static it should not be used and as such is private.

10.2.2.2 ~CommandLineHandler()

```
cli::CommandLineHandler::~CommandLineHandler ( )  [delete]
```

The Destructor of the CommandLineHandler Class.

Note

As all functions are static it should not be used and as such is private.

10.2.3 Member Function Documentation

10.2.3.1 parseArguments()

```
std::tuple< std::optional< std::string >, std::vector< std::string > > cli::CommandLine↩
Handler::parseArguments (
            int argc,
            char * argv[] )  [static]
```

Parses the Command Line Arguments.

This function uses the "getopt.h" library to parse all options given and then returns all files which are given as arguments.

Parameters

argc	The number of arguments given
argv	The arguments given

Exceptions

std::logic_error	

Returns

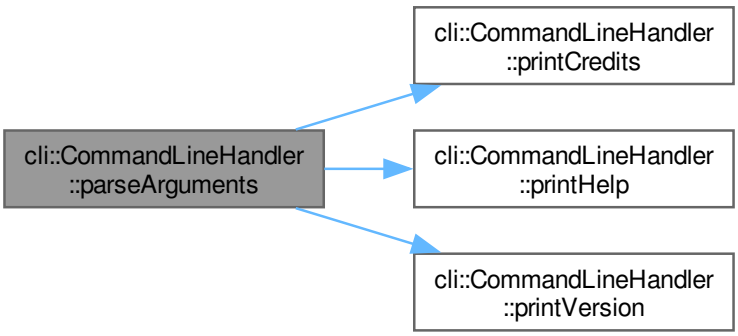
Returns a vector of strings containing all filenames.

Todo Update documentation

Definition at line 67 of file CommandLineHandler.cpp.

References printCredits(), printHelp(), and printVersion().

Here is the call graph for this function:



Here is the caller graph for this function:

10.2.3.2 printCredits()

```
void cli::CommandLineHandler::printCredits ( )  [static]
```

Prints the credits message.

Prints the credits message when called.

Note

This function ends the application.

- std::vector< std::tuple< std::string, std::string > > environmentVariables
- std::vector< std::string > pathValues

10.5.1 Detailed Description

This class contains all data from the json file.

The data from the json file is parsed by the JsonHandler and then assigned to the attributes of an instance of this class. This class also handles a part of the error handling.

Definition at line 30 of file FileData.hpp.

10.5.2 Member Function Documentation

10.5.2.1 addCommand()

```
void parsing::FileData::addCommand (
            const std::string & command )
```

Adds a given command to this->commands.

Makes sure, that the given command value is not empty and then add's it to the commands attribute.

Parameters

command	The command to be added

Exceptions

exceptions::InvalidValueException	

Definition at line 55 of file FileData.cpp.

References commands.

10.5.2.2 addEnvironmentVariable()

```
void parsing::FileData::addEnvironmentVariable (
            const std::string & name,
            const std::string & value )
```

Adds a given tuple to this->environmentVariables.

Makes sure that neither the key nor the value is empty and then adds a tuple with both values to the environment↩ Variables attribute

Parameters

name	The name of the env variable
value	The value of the env variable

Exceptions

exceptions::InvalidValueException	

Definition at line 66 of file FileData.cpp.

References environmentVariables.

10.5.2.3 addPathValue()

```
void parsing::FileData::addPathValue (
            const std::string & pathValue )
```

Add's a given value to this->pathValues.

Makes sure that the given value is not empty and then assigns it to the given pathValues attribute

Parameters

pathValue	The value to be added

Exceptions

exceptions::InvalidValueException	

Definition at line 83 of file FileData.cpp.

References pathValues.

10.5.2.4 getApplication()

```
const std::optional< std::string > & parsing::FileData::getApplication ( ) const  [inline]
```

Getter for this->application.

Returns

The assigned application

Definition at line 120 of file FileData.hpp.

References application.

10.5.2.5 getCommands()

```
const std::vector< std::string > & parsing::FileData::getCommands ( ) const  [inline]
```

Getter for this->commands.

Returns

The vector of assigned commands

Definition at line 128 of file FileData.hpp.

References commands.

10.5.2.6 getEnvironmentVariables()

```
const std::vector< std::tuple< std::string, std::string > > & parsing::FileData::getEnvironment↩
Variables ( ) const  [inline]
```

Getter for this->environmentVariables.

Returns

The vector of assigned env variables

Definition at line 137 of file FileData.hpp.

References environmentVariables.

10.5.2.7 getHideShell()

```
bool parsing::FileData::getHideShell ( ) const  [inline]
```

Getter for this->hideShell.

Returns

The assigned value for hideshell

Definition at line 112 of file FileData.hpp.

References hideShell.

10.5.2.8 getOutputFile()

```
const std::string & parsing::FileData::getOutputFile ( ) const  [inline]
```

Getter for this->outputfile.

Returns

The assigned outputfile

Definition at line 104 of file FileData.hpp.

References outputfile.

10.5.2.9 getPathValues()

```
const std::vector< std::string > & parsing::FileData::getPathValues ( ) const  [inline]
```

Getter for this->pathValues.

Returns

The vector of assigned pathValues

Definition at line 145 of file FileData.hpp.

References pathValues.

10.5.2.10 setApplication()

```
void parsing::FileData::setApplication (
            const std::string & newApplication )
```

Setter for this->application.

Set's the application attribute. Return's if the given string is empty.

Parameters

newApplication	THe application to be set

Definition at line 44 of file FileData.cpp.

References application.

10.5.2.11 setHideShell()

```
void parsing::FileData::setHideShell (
            bool newHideShell )  [inline]
```

Setter for this->hideshell.

Parameters

newHideShell	The hideshell value to be set

Definition at line 48 of file FileData.hpp.

References hideShell.

10.5.2.12 setOutputFile()

```
void parsing::FileData::setOutputFile (
            std::string & newOutputfile )
```

Setter for this->outputfile.

Checks that neither the given string is empty, nor that the outputfile is already set and then assigns the newOutputfile to the instance.

Parameters

newOutputfile	The outputfile to be set

Exceptions

exceptions::InvalidValueException	

Definition at line 17 of file FileData.cpp.

References outputfile.

10.5.3 Member Data Documentation

10.5.3.1 application

```
std::optional<std::string> parsing::FileData::application  [private]
```

Definition at line 152 of file FileData.hpp.

10.5.3.2 commands

```
std::vector<std::string> parsing::FileData::commands  [private]
```

Definition at line 153 of file FileData.hpp.

10.5.3.3 environmentVariables

```
std::vector<std::tuple<std::string, std::string> > parsing::FileData::environmentVariables
[private]
```

Definition at line 154 of file FileData.hpp.

10.5.3.4 hideShell

```
bool parsing::FileData::hideShell  [private]
```

Definition at line 151 of file FileData.hpp.

10.5.3.5 outputfile

```
std::string parsing::FileData::outputfile  [private]
```

Definition at line 150 of file FileData.hpp.

10.5.3.6 pathValues

```
std::vector<std::string> parsing::FileData::pathValues  [private]
```

Definition at line 155 of file FileData.hpp.

10.8.1 Detailed Description

Exception for invalid types.

This exception is thrown when the value of the "type" field within the entries is invalid (not "EXE", "PATH", "ENV"). It also prints the type and the line of the invalid type.

Definition at line 156 of file Exceptions.hpp.

10.8.2 Constructor & Destructor Documentation

10.8.2.1 InvalidTypeException()

```
exceptions::InvalidTypeException::InvalidTypeException (
            const std::string & type,
            int line )  [inline]
```

Note

I planned to use std::format, however it seems that the required Compiler Version is not yet available in the stable Ubuntu Repo!

Definition at line 162 of file Exceptions.hpp.

References message, and type.

10.8.3 Member Function Documentation

10.8.3.1 what()

```
const char * exceptions::InvalidTypeException::what ( ) const  [inline], [override], [noexcept]
```

Definition at line 173 of file Exceptions.hpp.

References message.

10.8.4 Member Data Documentation

10.8.4.1 message

```
std::string exceptions::InvalidTypeException::message  [private]
```

Definition at line 159 of file Exceptions.hpp.

10.8.4.2 type

```
const std::string exceptions::InvalidTypeException::type  [private]
```

Definition at line 158 of file Exceptions.hpp.

The documentation for this class was generated from the following file:

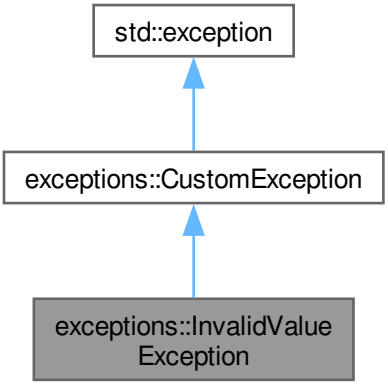
- src/include/Exceptions.hpp

10.9 exceptions::InvalidValueException Class Reference

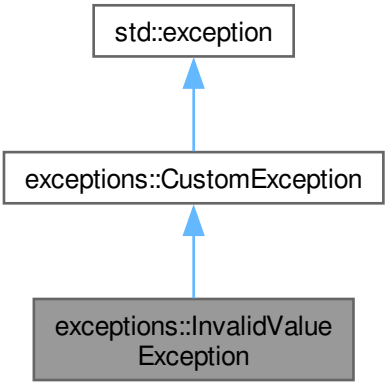
Exception for an ivalid (usually empty) value field.

`#include <Exceptions.hpp>`

Inheritance diagram for exceptions::InvalidValueException:



Collaboration diagram for exceptions::InvalidValueException:



Public Member Functions

- InvalidValueException (const std::string &key, const std::string &issue)
- const char * what () const noexcept override

Public Member Functions inherited from exceptions::CustomException

- const char * what () const noexcept override

Private Attributes

- const std::string key
- std::string message

10.9.1 Detailed Description

Exception for an ivalid (usually empty) value field.

Definition at line 96 of file Exceptions.hpp.

10.9.2 Constructor & Destructor Documentation

10.9.2.1 InvalidValueException()

```
exceptions::InvalidValueException::InvalidValueException (
            const std::string & key,
            const std::string & issue )  [inline]
```

Note

I planned to use std::format, however it seems that the required Compiler Version is not yet available in the stable Ubuntu Repo!

Definition at line 102 of file Exceptions.hpp.

References key, and message.

10.9.3 Member Function Documentation

10.9.3.1 what()

```
const char * exceptions::InvalidValueException::what ( ) const  [inline], [override], [noexcept]
```

Definition at line 114 of file Exceptions.hpp.

References message.

10.9.4 Member Data Documentation

10.9.4.1 key

```
const std::string exceptions::InvalidValueException::key  [private]
```

Definition at line 98 of file Exceptions.hpp.

10.9.4.2 message

```
std::string exceptions::InvalidValueException::message  [private]
```

Definition at line 99 of file Exceptions.hpp.

The documentation for this class was generated from the following file:

- src/include/Exceptions.hpp

10.10 parsing::JsonHandler Class Reference

This file reads all data from the json file.

```
#include <JsonHandler.hpp>
```

Public Member Functions

- JsonHandler ()
  Constructor without arguments.
- JsonHandler (const std::string &filename)
  The constructor.
- std::shared_ptr< FileData > getFileData ()
  Retrieve the data from the json file.

Private Member Functions

- void assignOutputFile () const
  Assigns the outputfile to this->data.
- void assignHideShell () const
  Assigns the hideshell value to this->data.
- void assignApplication () const
  Assigns application to this->data.
- void assignEntries () const
  Assigns entries to this->data.
- void assignCommand (const Json::Value &entry) const
  Assigns an command to this->data.
- void assignEnvironmentVariable (const Json::Value &entry) const
  Assigns an environmentVariable to this->data.
- void assignPathValue (const Json::Value &entry) const
  Assigns a path value to this->data.
- std::shared_ptr< FileData > createFileData ()
  Creates the FileData instance.

Static Private Member Functions

- static std::shared_ptr< Json::Value > parseFile (const std::string &filename)

  Parses the given json file.

Private Attributes

- std::shared_ptr< Json::Value > root
- std::shared_ptr< FileData > data

10.10.1 Detailed Description

This file reads all data from the json file.

This file uses the jsoncpp library to parse all data from a json file, validate it to some degree.

See also

https://github.com/open-source-parsers/jsoncpp

Definition at line 45 of file JsonHandler.hpp.

10.10.2 Constructor & Destructor Documentation

10.10.2.1 JsonHandler() [1/2]

```
parsing::JsonHandler::JsonHandler ( )  [inline]
```

Constructor without arguments.

This constructor can be used to initialise an instance in an outer scope and then assign it values from an inner scope.

Definition at line 53 of file JsonHandler.hpp.

10.10.2.2 JsonHandler() [2/2]

```
parsing::JsonHandler::JsonHandler (
            const std::string & filename )  [explicit]
```

The constructor.

This constructor calls this->parseFile() when called.

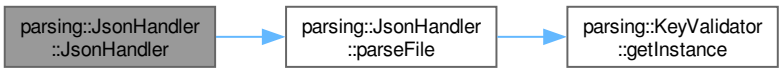
Parameters

filename	Name of the json file

Definition at line 20 of file JsonHandler.cpp.

References parseFile(), and root.

Here is the call graph for this function:



10.10.3 Member Function Documentation

10.10.3.1 assignApplication()

```
void parsing::JsonHandler::assignApplication ( ) const  [private]
```

Assigns application to this->data.

Retrieves the value of the application key from Json::Value this->root and defaults to an empty string.

Definition at line 77 of file JsonHandler.cpp.

References data, and root.

Here is the caller graph for this function:

10.10.3.2 assignCommand()

```
void parsing::JsonHandler::assignCommand (
            const Json::Value & entry ) const  [private]
```

Assigns an command to this->data.

Parameters

entry	The entry with the command

Definition at line 107 of file JsonHandler.cpp.

References data.

Here is the caller graph for this function:

10.10.3.3 assignEntries()

```
void parsing::JsonHandler::assignEntries ( ) const  [private]
```

Assigns entries to this->data.

Goes through each of the entries from Json::Value this->root and calls the relevant method depending on it's type. All "type" keys should be valid by this point.

Parameters

entry	Json::Value containing an array with entries

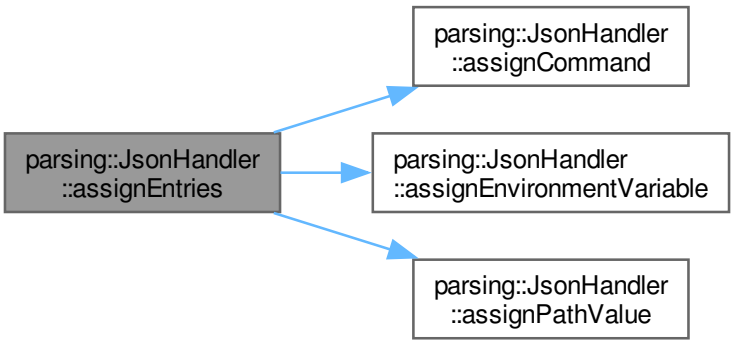
Exceptions

exceptions::UnreachableCodeException	

Definition at line 83 of file JsonHandler.cpp.

References assignCommand(), assignEnvironmentVariable(), assignPathValue(), and root.

Here is the call graph for this function:



Here is the caller graph for this function:

10.10.3.4 assignEnvironmentVariable()

```
void parsing::JsonHandler::assignEnvironmentVariable (
            const Json::Value & entry ) const  [private]
```

Assigns an environmentVariable to this->data.

Parameters

entry	The entry with the environmentVariable

Definition at line 113 of file JsonHandler.cpp.

References data.

Here is the caller graph for this function:

10.10.3.5 assignHideShell()

```
void parsing::JsonHandler::assignHideShell ( ) const  [private]
```

Assigns the hideshell value to this->data.

Retrieves the value of the hideshell key from Json::Value this->root and defaults to negative.

Definition at line 70 of file JsonHandler.cpp.

References data, and root.

Here is the caller graph for this function:

10.10.3.6 assignOutputFile()

```
void parsing::JsonHandler::assignOutputFile ( ) const  [private]
```

Assigns the outputfile to this->data.

Retrieves the outputfile from Json::Value this->root and makes sure, that the file doesn't already exist.

Exceptions

exceptions::FileExistsException	

Definition at line 63 of file JsonHandler.cpp.

References data, and root.

Here is the caller graph for this function:

10.10.3.7 assignPathValue()

```
void parsing::JsonHandler::assignPathValue (
            const Json::Value & entry ) const  [private]
```

Assigns a path value to this->data.

Parameters

entry	The entry with the path value

Definition at line 120 of file JsonHandler.cpp.

References data.

Here is the caller graph for this function:

10.10.3.8 createFileData()

```
std::shared_ptr< FileData > parsing::JsonHandler::createFileData ( )  [private]
```

Creates the FileData instance.

Instantiates the FileData instance, calls all nessecary functions and returns a shared pointer to it.

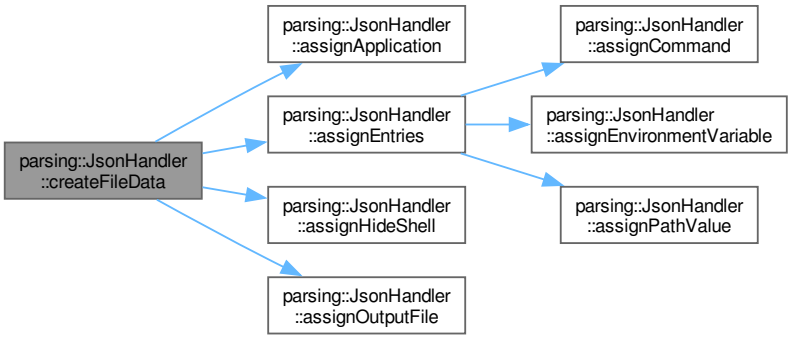
Returns

Pointer to the created instance of FileData

Definition at line 53 of file JsonHandler.cpp.

References assignApplication(), assignEntries(), assignHideShell(), assignOutputFile(), and data.

Here is the call graph for this function:



Here is the caller graph for this function:

10.10.3.9 getFileData()

```
std::shared_ptr< FileData > parsing::JsonHandler::getFileData ( )
```

Retrieve the data from the json file.

This method calls this->createFileData() needed to retrieve the values from the Json::Value this->root and then returns a shared pointer to the created FileData object.

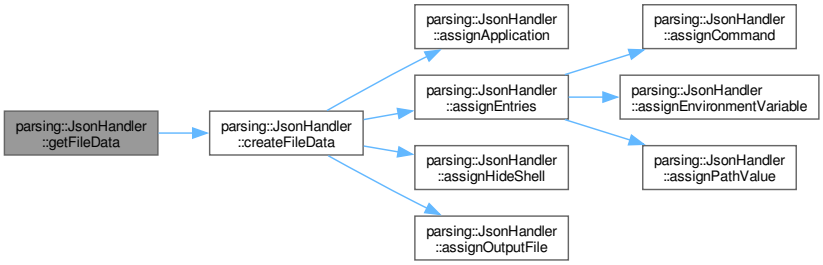
Returns

Pointer to the FileData Object with the parsed data from json

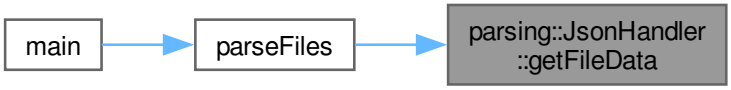
Definition at line 48 of file JsonHandler.cpp.

References createFileData().

Here is the call graph for this function:



Here is the caller graph for this function:



10.10.3.10 parseFile()

```
std::shared_ptr< Json::Value > parsing::JsonHandler::parseFile (
            const std::string & filename )  [static], [private]
```

Parses the given json file.

This method first creates a new Json::Value instance and then tries to parse the given json file. It then validates the keys of the instance using the KeyValidator class.

Parameters

filename	The name of the file wich should be parsed

Returns

A shared pointer to the Json::Value instance

See also

KeyValidator::validateKeys()

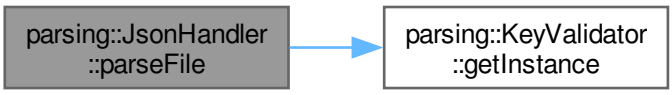
Exceptions

exceptions::ParsingException	
exceptions::InvalidKeyException	

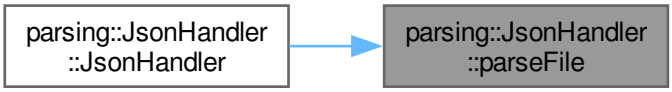
Definition at line 25 of file JsonHandler.cpp.

References parsing::KeyValidator::getInstance().

Here is the call graph for this function:



Here is the caller graph for this function:



10.10.4 Member Data Documentation

10.10.4.1 data

```
std::shared_ptr<FileData> parsing::JsonHandler::data  [private]
```

Definition at line 153 of file JsonHandler.hpp.

10.10.4.2 root

```
std::shared_ptr<Json::Value> parsing::JsonHandler::root  [private]
```

Definition at line 152 of file JsonHandler.hpp.

The documentation for this class was generated from the following files:

- src/include/JsonHandler.hpp
- src/sources/JsonHandler.cpp

10.11 parsing::KeyValidator Class Reference

Validates keys of a Json::Value object.

```
#include <KeyValidator.hpp>
```

Public Member Functions

- std::vector< std::tuple< int, std::string > > validateKeys (const Json::Value &root, const std::string &filename)

  Validate keys off a Json::Value object.

Static Public Member Functions

- static KeyValidator & getInstance ()

  Get the instance of this class.

Private Member Functions

- std::vector< std::tuple< int, std::string > > getWrongKeys (const Json::Value &root, const std::string &filename)

  Retrieve the wrong keys from a Json::Value object.
- std::vector< std::tuple< int, std::string > > validateEntries (const std::string &filename, const std::vector< std::string > &entryKeys)

  Validates that an entries 'type' key is valid.

Static Private Member Functions

- static void validateTypes (const std::string &filename, const Json::Value &entry, std::vector< std::string > &entryKeys)

  Validates types from the entries array.
- static std::optional< int > getUnknownKeyLine (const std::string &filename, const std::string &wrongKey)

Private Attributes

- std::vector< std::string > validKeys
- std::vector< std::string > validEntryKeys

10.11.1 Detailed Description

Validates keys of a Json::Value object.

This class is singleton. That way when multiple files are parsed with the application, the validKeys and validEntryKeys field only have to be allocated once.

Definition at line 26 of file KeyValidator.hpp.

10.11.2 Member Function Documentation

10.11.2.1 getInstance()

```
KeyValidator & parsing::KeyValidator::getInstance ( )  [static]
```

Get the instance of this class.

Returns

Reference to the instance of this class

Definition at line 19 of file KeyValidator.cpp.

Here is the caller graph for this function:

10.11.2.2 getUnknownKeyLine()

```
std::optional< int > parsing::KeyValidator::getUnknownKeyLine (
            const std::string & filename,
            const std::string & wrongKey )  [static], [private]
```

Parameters

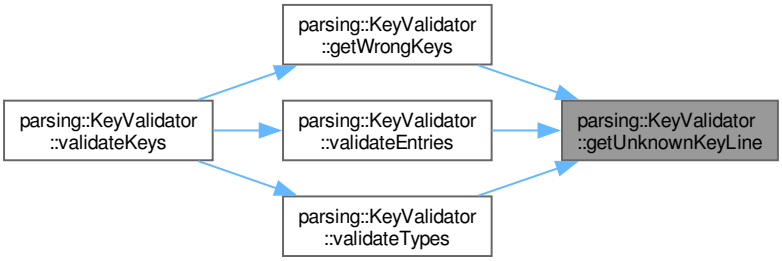
filename	
wrongKey	

Returns

Todo Documentation

Definition at line 151 of file KeyValidator.cpp.

Here is the caller graph for this function:



10.11.2.3 getWrongKeys()

```
std::vector< std::tuple< int, std::string > > parsing::KeyValidator::getWrongKeys (
            const Json::Value & root,
            const std::string & filename )  [private]
```

Retrieve the wrong keys from a Json::Value object.

This method goes through each key of the Json::Value object and makes sure it's valid.

Parameters

root	The Json::Value object to be validated.
filename	The filename from which 'root' is from.

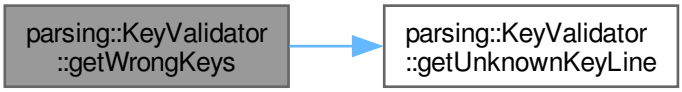
Returns

A vector with tuples, containing the line and name of invalid types.

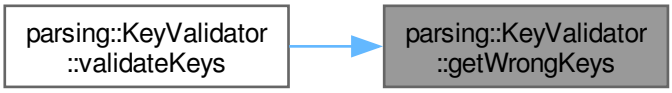
Definition at line 53 of file KeyValidator.cpp.

References getUnknownKeyLine(), and validKeys.

Here is the call graph for this function:



Here is the caller graph for this function:



10.11.2.4 validateEntries()

```
std::vector< std::tuple< int, std::string > > parsing::KeyValidator::validateEntries (
            const std::string & filename,
            const std::vector< std::string > & entryKeys )  [private]
```

Validates that an entries 'type' key is valid.

Parameters

filename	
entryKeys	

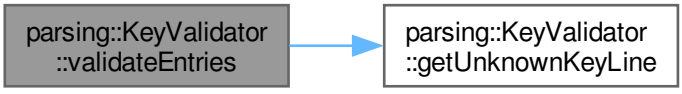
Returns

Todo Documentation

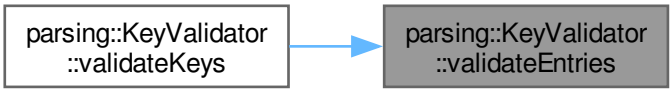
Definition at line 80 of file KeyValidator.cpp.

References getUnknownKeyLine(), and validEntryKeys.

Here is the call graph for this function:



Here is the caller graph for this function:



10.11.2.5 validateKeys()

```
std::vector< std::tuple< int, std::string > > parsing::KeyValidator::validateKeys (
            const Json::Value & root,
            const std::string & filename )
```

Validate keys off a Json::Value object.

This method goes through the MemberNames of a Json::Value object and validates, that they are part of the valid↩ Key attribute. It calls the nessecary methods to validate the keys within the entries array.

Parameters

root	The Json::Value object to be validated.
filename	The filename from which 'root' is from.

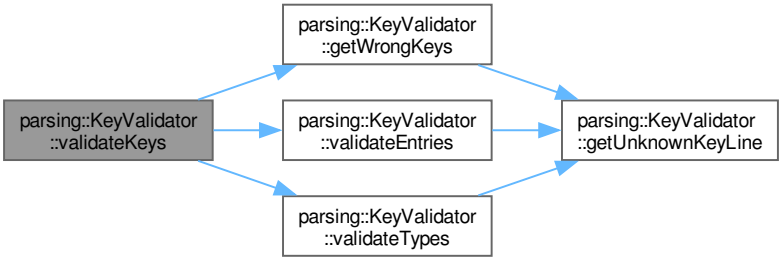
Returns

A vector with tuples, containing the line and name of invalid types.

Definition at line 25 of file KeyValidator.cpp.

References getWrongKeys(), validateEntries(), and validateTypes().

Here is the call graph for this function:



10.11.2.6 validateTypes()

```
void parsing::KeyValidator::validateTypes (
            const std::string & filename,
            const Json::Value & entry,
            std::vector< std::string > & entryKeys )  [static], [private]
```

Validates types from the entries array.

Makes sure that each type has it's according keys, needed to parse it.

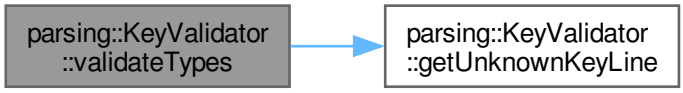
Parameters

filename	The filename from which 'entry' is from
entry	
entryKeys	

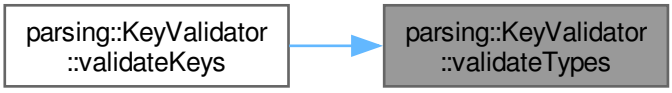
Definition at line 106 of file KeyValidator.cpp.

References getUnknownKeyLine().

Here is the call graph for this function:



Here is the caller graph for this function:



10.11.3 Member Data Documentation

10.11.3.1 validEntryKeys

```
std::vector<std::string> parsing::KeyValidator::validEntryKeys  [private]
```

Initial value:

```
= {"type", "key", "value", "path",
        "command"
    }
```

Definition at line 111 of file KeyValidator.hpp.

10.11.3.2 validKeys

```
std::vector<std::string> parsing::KeyValidator::validKeys  [private]
```

Initial value:
```
= {"outputfile", "hideshell", "entries",
        "application"
    }
```

10.18 utilities::Utils Class Reference

Responsible for utility function.

`#include <Utils.hpp>`

Static Public Member Functions

- static void setupEasyLogging (const std::string &configFile)
  Set up easylogging.
- static bool checkIfFileExists (const std::string &fileName)
  Check if a file exists.
- static bool checkFileEnding (const std::string_view &fileName)
  Checks if the file ending is ".json".
- static bool askToContinue (const std::string &prompt="Do you want to continue? (Y/N)\n")
  Asks if the user wants to continue.
- static std::string & checkDirectory (std::string &directory)

10.18.1 Detailed Description

Responsible for utility function.

This class is responsible for handling miscellaneous utility functions which be used throughout the whole project.

Definition at line 39 of file Utils.hpp.

10.18.2 Member Function Documentation

10.18.2.1 askToContinue()

```
bool utilities::Utils::askToContinue (
            const std::string & prompt = "Do you want to continue? (Y/N)\n" )  [static]
```

Asks if the user wants to continue.

Asks the user if they want to continue and prompts them for a response.

Parameters

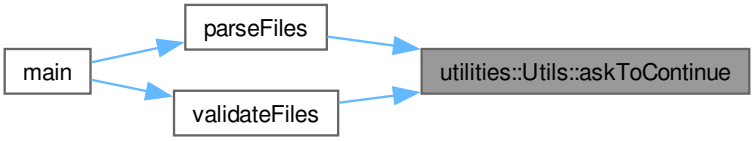
prompt	(Optional) A custom prompt to be used.

Returns

Returns true if the user wants to continue and false otherwise.

Definition at line 42 of file Utils.cpp.

Here is the caller graph for this function:



10.18.2.2 checkDirectory()

```
std::string & utilities::Utils::checkDirectory (
            std::string & directory )  [static]
```

10.18.2.3 checkFileEnding()

```
bool utilities::Utils::checkFileEnding (
            const std::string_view & fileName )  [static]
```

Checks if the file ending is ".json".

This function checks if the given file ends with ".json".

Parameters

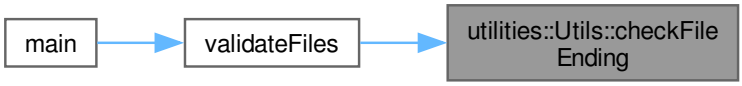
fileName	The file which should be checked.

Returns

Returns true if the file ends with ".json" and false otherwise.

Definition at line 39 of file Utils.cpp.

Here is the caller graph for this function:



10.18.2.4 checkIfFileExists()

```
bool utilities::Utils::checkIfFileExists (
            const std::string & fileName )  [static]
```

Check if a file exists.

This function checks if a file exists by trying to open it using fstream.

Parameters

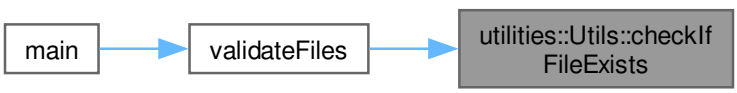
fileName	The file which should be checked.

Returns

Returns true if the file exists and false otherwise

Definition at line 34 of file Utils.cpp.

Here is the caller graph for this function:



10.18.2.5 setupEasyLogging()

```
void utilities::Utils::setupEasyLogging (
            const std::string & configFile )  [static]
```

Set up easylogging.

This function sets up the easylogging library based on the given config file.

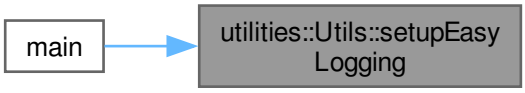
Parameters

configFile	The config file which is used

Definition at line 26 of file Utils.cpp.

References HOMEPAGE_URL, MAJOR_VERSION, MINOR_VERSION, PATCH_VERSION, and PROJECT_NAME.

Here is the caller graph for this function:



The documentation for this class was generated from the following files:

- src/include/Utils.hpp

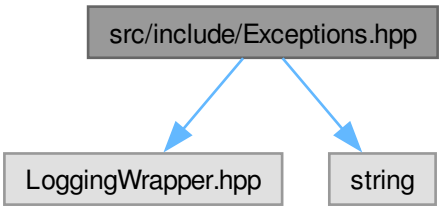
11.8 src/include/Exceptions.hpp File Reference

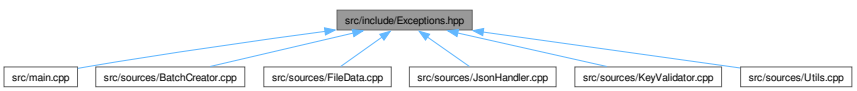
Contains all the custom exceptions used in the project.

```
#include "LoggingWrapper.hpp"
#include <string>
```

Include dependency graph for Exceptions.hpp:



This graph shows which files directly or indirectly include this file:



Classes

- class exceptions::CustomException

  Base class for all custom exceptions.
- class exceptions::ParsingException

  Exception for syntax errors within the json file.
- class exceptions::FileExistsException

  Exception for an already exisiting outputfile.
- class exceptions::InvalidValueException

  Exception for an ivalid (usually empty) value field.
- class exceptions::InvalidKeyException

  Exception for invalid keys.
- class exceptions::InvalidTypeException

  Exception for invalid types.
- class exceptions::MissingKeyException

  Exception for missing keys within entries.
- class exceptions::MissingTypeException

  Exception for missing types of entries.
- class exceptions::UnreachableCodeException

  Exception for when the application reaches code it shouldn't reach.
- class exceptions::FailedToOpenFileException
- class exceptions::NoSuchDirException

Namespaces

- namespace exceptions

  Namespace used for customized exceptions.

11.8.1 Detailed Description

Contains all the custom exceptions used in the project.

Definition in file main.cpp.

11.18.2 Function Documentation

11.18.2.1 main()

```
int main (
            int argc,
            char * argv[] )
```

Main function of the program.

The main function is responsible for connection all parts of the programm. It calls all relevant classes and finishes when everything is done.

Parameters

argc	The number of arguments given
argv	Th command line arguments given

Returns

Returns 0 on success, 1 on failure
