Chapter 1

JSON2Batch

1.1 JSON2Batch

JSON2Batch was developed during a project during our first and second semester of university. It generates batch files from JSON files, which can spawn terminals or applications, that run under certain parameters specified within the JSON file.

The project was carried out by **Elena Schwarzbach, Max Rodler, Simon Blum, Sonia Sinaci**.

1.1.1 Table of Contents

- JSON2Batch
 - 1. Table of Contents
 - 2. Build Instructions
 - Linux
 - Windows
 - Generating Documentation
 - 3. Documentation
 - Project Structure
 - 4. External Libraries
 - easylogging++
 - LoggingWrapper
 - jsoncpp
 - 5. License

1.1.2 Build Instructions

1.1.2.1 Linux

```
git clone https://github.com/DHBWProjectsIT23/JSON2Bat/!TODO
cmake -S . -B build --config Release
cmake --build build
```

UNIX Compiler Compatibility

The project has been tested with GCC version ≥ 10.5 and Clang version > 14 .

1.1.2.2 Windows

@TODO Fix Windows

Windows Compiler Compatibility

1.1.2.3 Generating Documentation

If the *doxygen* executable is installed local documentation can be generated using:

```
git clone https://github.com/DHBWProjectsIT23/JSON2Bat/!TODO
cmake -S . -B build --config Release
cmake --build build --target doxygen_build
```

1.1.3 Documentation

The documentation for this project can be found [here](#). A PDF version can be found [\[here\]\(\)](#) and a short man page can be found [\[here\]\(\)](#).

1.1.3.1 Project Structure

The project directory is structured as follows:

- `assets` > *Includes files, not directly related to the code*
- `man` > *Includes the man page*
- `conf` > *Includes files which will be configured by CMake*
- `include` > *Includes header files for external libraries*
- `lib` > *Includes source/binary files for external libraries*
- `src` > *Includes the source code for the project*
 - `sources` > *Includes all ".cpp" files*
 - `include` > *Includes all ".hpp" files*
 - [main.cpp](#)

1.1.4 External Libraries

1.1.4.1 easylogging++

The [easylogging++](#) library is used for logging within the application. The configuration for the library is done via a logging file which can be found in [conf/easylogging.in.conf](#). Cmake configures this file into the binary directory upon building. If the configuration file is removed, the application will no longer run.

1.1.4.2 LoggingWrapper

While easylogging++ is used for the logging back-end within the code there are little remains apart from the configuration. The logging and output of the application is done over a self written wrapper. Although it is self written, due to it being not part of the project we consider it an external libraries. The wrapper is used to simplify parallel output to stdout and the logfile and also enables increased output to stdout for the verbose mode. A few macros are defined for use within the application:

- `OUTPUT` > *Outputs to stdout and the logfile*
- `LOG_INFO` > *By default only outputs to the logfile*
- `LOG_WARNING` > *Formats text and outputs to stdout and the logfile*
- `LOG_ERROR` > *Same as `LOG_WARNING` but in red and bold*

The macros can be used with streaming in the same way as `std::cout` would be used. Furthermore, some rudimentary performance tests showed, that the use of the wrapper, does not affect performance in comparison to using both `std::cout` and easylogging itself.

1.1.4.3 jsoncpp

For parsing the JSON files, the `jsoncpp` library is used. On UNIX system this library can simply be installed using the systems package manager (tested with WSL/Ubuntu and Arch). For Windows system a prebuild version is included - See Windows for more information.

1.1.5 License

The project is published under the Apache License V2.0. Check the [license file](LICENSE) for more information!

Chapter 2

Topic Index

2.1 Topics

Here is a list of all topics with brief descriptions:

StyleHelpers	15
------------------------	----

Chapter 3

Namespace Index

3.1 Namespace List

Here is a list of all namespaces with brief descriptions:

cli	Includes everything regarding the CLI	17
config	Namespace used for general project information	18
exceptions	Namespace used for customized exceptions	20
parsing	The namespace containing everything relevant to parsing	20
utilities	Includes all utilities	21

Chapter 4

Hierarchical Index

4.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

BatchCreator	23
cli::CommandLineHandler	30
std::exception	
exceptions::CustomException	35
exceptions::FailedToOpenFileException	36
exceptions::FileExistsException	45
exceptions::InvalidKeyException	47
exceptions::InvalidTypeException	49
exceptions::InvalidValueException	51
exceptions::MissingKeyException	69
exceptions::MissingTypeException	72
exceptions::NoSuchDirException	74
exceptions::ParsingException	76
exceptions::UnreachableCodeException	78
parsing::FileData	38
parsing::JsonHandler	53
parsing::KeyValidator	62
options	76
utilities::Utils	80

Chapter 5

Class Index

5.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

BatchCreator	Creates a batch file from a FileData obeject	23
cli::CommandLineHandler	Responsible for the Command Line Interface	30
exceptions::CustomException	Base class for all custom exceptions	35
exceptions::FailedToOpenFileException	Exception for when a file can't be opened	36
parsing::FileData	This class contains all data from the json file	38
exceptions::FileExistsException	Exception for an already exisiting outputfile	45
exceptions::InvalidKeyException	Exception for invalid keys	47
exceptions::InvalidTypeException	Exception for invalid types	49
exceptions::InvalidValueException	Exception for an ivalid (usually empty) value field	51
parsing::JsonHandler	This file reads all data from the json file	53
parsing::KeyValidator	Validates keys of a Json::Value object	62
exceptions::MissingKeyException	Exception for missing keys within entries	69
exceptions::MissingTypeException	Exception for missing types of entries	72
exceptions::NoSuchDirException	Exception for when a directory does not exist	74
options	The struct containing all possible options	76
exceptions::ParsingException	Exception for syntax errors within the json file	76
exceptions::UnreachableCodeException	Exception for when the application reaches code it shouldn't reach	78
utilities::Utils	Responsible for utility function	80

Chapter 6

File Index

6.1 File List

Here is a list of all files with brief descriptions:

src/main.cpp	
Contains the main function	103
src/include/BatchCreator.hpp	
Contains the BatchCreator class	85
src/include/CommandLineHandler.hpp	
Responsible for the Command Line Interface	87
src/include/config.hpp	
Configures general project information	89
src/include/Exceptions.hpp	
Contains all the custom exceptions used in the project	91
src/include/FileData.hpp	
This file contains the FileData class	95
src/include/JsonHandler.hpp	
This file contains the JsonHandler class	97
src/include/KeyValidator.hpp	
This file contains the KeyValidator class	99
src/include/Utils.hpp	
.	101
src/sources/BatchCreator.cpp	
Contains the implementation of the BatchCreator class	110
src/sources/CommandLineHandler.cpp	
Implementation for the Command Line Interface	112
src/sources/FileData.cpp	
Implementation of the FileData class	115
src/sources/JsonHandler.cpp	
Implementation of the JsonHandler class	117
src/sources/KeyValidator.cpp	
Implementation for the KeyValidator class	119
src/sources/Utils.cpp	
Implementation for the Utils class	122

Chapter 7

Topic Documentation

7.1 StyleHelpers

Static variables to help with CLI styling.

Static variables to help with CLI styling.

A group of strings, that use escape sequences to easily style the command line interface on Unix systems. When compiling for Windows all of these strings will be empty, as escape sequences can't be used the same way.

Chapter 8

Namespace Documentation

8.1 cli Namespace Reference

Includes everything regarding the CLI.

Classes

- class [CommandLineHandler](#)
Responsible for the Command Line Interface.

Variables

- static const struct option [options](#) []

8.1.1 Detailed Description

Includes everything regarding the CLI.

This namespace includes all the code regarding the Command Line Interface. This includes the [CommandLineHandler](#) Class, the struct for the options and helpers for Styling.

See also

[CommandLineHandler](#)
[options](#)
[StyleHelpers](#)

8.1.2 Variable Documentation

8.1.2.1 options

```
const struct option cli::options[] [static]
```

Initial value:

```
= {
    {"help", no_argument, nullptr, 'h'},
    {"version", no_argument, nullptr, 'v'},
    {"credits", no_argument, nullptr, 'c'},
    {"verbose", no_argument, nullptr, 0},
    {"outdir", required_argument, nullptr, 'o'},
    nullptr
}
```

Definition at line 111 of file [CommandLineHandler.hpp](#).

8.2 config Namespace Reference

Namespace used for general project information.

Variables

- constexpr auto [LOG_CONFIG](#)
- constexpr auto [EXECUTABLE_NAME](#) = "json2batch"
- constexpr auto [MAJOR_VERSION](#) = "0"
- constexpr auto [MINOR_VERSION](#) = "2"
- constexpr auto [PATCH_VERSION](#) = "2"
- constexpr auto [DESCRIPTION](#) = "A simple tool to convert json to batch."
- constexpr auto [PROJECT_NAME](#) = "JSON2Batch"
- constexpr auto [AUTHORS](#) = "@AUTHORS"
- constexpr auto [HOMEPAGE_URL](#)

8.2.1 Detailed Description

Namespace used for general project information.

8.2.2 Variable Documentation

8.2.2.1 AUTHORS

```
constexpr auto config::AUTHORS = "@AUTHORS" [inline], [constexpr]
```

Definition at line 34 of file [config.hpp](#).

8.2.2.2 DESCRIPTION

```
constexpr auto config::DESCRIPTION = "A simple tool to convert json to batch." [inline],
[constexpr]
```

Definition at line 32 of file [config.hpp](#).

8.2.2.3 EXECUTABLE_NAME

```
constexpr auto config::EXECUTABLE_NAME = "json2batch" [inline], [constexpr]
```

Definition at line 28 of file [config.hpp](#).

8.2.2.4 HOMEPAGE_URL

```
constexpr auto config::HOMEPAGE_URL [inline], [constexpr]
```

Initial value:

```
=  
    "https://dhwprojectsit23.github.io/JSON2Bat "
```

Definition at line 35 of file [config.hpp](#).

8.2.2.5 LOG_CONFIG

```
constexpr auto config::LOG_CONFIG [inline], [constexpr]
```

Initial value:

```
=  
    "/home/simon/1_Coding/cpp/JsonToBat/build/Debug/config/easylogging.conf"
```

Definition at line 26 of file [config.hpp](#).

8.2.2.6 MAJOR_VERSION

```
constexpr auto config::MAJOR_VERSION = "0" [inline], [constexpr]
```

Definition at line 29 of file [config.hpp](#).

8.2.2.7 MINOR_VERSION

```
constexpr auto config::MINOR_VERSION = "2" [inline], [constexpr]
```

Definition at line 30 of file [config.hpp](#).

8.2.2.8 PATCH_VERSION

```
constexpr auto config::PATCH_VERSION = "2" [inline], [constexpr]
```

Definition at line 31 of file [config.hpp](#).

8.2.2.9 PROJECT_NAME

```
constexpr auto config::PROJECT_NAME = "JSON2Batch" [inline], [constexpr]
```

Definition at line 33 of file [config.hpp](#).

8.3 exceptions Namespace Reference

Namespace used for customized exceptions.

Classes

- class [CustomException](#)
Base class for all custom exceptions.
- class [FailedToOpenFileException](#)
Exception for when a file can't be opened.
- class [FileExistsException](#)
Exception for an already existing outputfile.
- class [InvalidKeyException](#)
Exception for invalid keys.
- class [InvalidTypeException](#)
Exception for invalid types.
- class [InvalidValueException](#)
Exception for an invalid (usually empty) value field.
- class [MissingKeyException](#)
Exception for missing keys within entries.
- class [MissingTypeException](#)
Exception for missing types of entries.
- class [NoSuchDirException](#)
Exception for when a directory does not exist.
- class [ParsingException](#)
Exception for syntax errors within the json file.
- class [UnreachableCodeException](#)
Exception for when the application reaches code it shouldn't reach.

8.3.1 Detailed Description

Namespace used for customized exceptions.

8.4 parsing Namespace Reference

The namespace containing everything relevant to parsing.

Classes

- class [FileData](#)
This class contains all data from the json file.
- class [JsonHandler](#)
This file reads all data from the json file.
- class [KeyValidator](#)
Validates keys of a `Json::Value` object.

8.4.1 Detailed Description

The namespace containing everything relevant to parsing.

This namespace contains all relevant classes to parsing the json file and creating the batch output.

See also

[JsonHandler](#)

[FileData](#)

[KeyValidator](#)

[BatchCreator](#)

8.5 utilities Namespace Reference

Includes all utilities.

Classes

- class [Utils](#)
Responsible for utility function.

8.5.1 Detailed Description

Includes all utilities.

This namespace includes the [Utils](#) class with utility functions which can be used throughout the project.

See also

[Utils](#)

Chapter 9

Class Documentation

9.1 BatchCreator Class Reference

Creates a batch file from a FileData object.

```
#include <BatchCreator.hpp>
```

Public Member Functions

- [BatchCreator](#) (std::shared_ptr< [parsing::FileData](#) > fileData)
Initializes the [BatchCreator](#).
- std::shared_ptr< std::stringstream > [getDataStream](#) () const
Returns the stringstream.

Private Member Functions

- void [createBatch](#) () const
Creates the batch stream.
- void [writeStart](#) () const
Writes the start of the batch file.
- void [writeHideShell](#) () const
Writes the visibility of the shell.
- void [writeCommands](#) () const
Writes the commands to be executed.
- void [writeEnvVariables](#) () const
Set's environment variables.
- void [writePathVariables](#) () const
Set's the path variables.
- void [writeApp](#) () const
If an application is given, it is started at the end.
- void [writeEnd](#) () const
Writes the end of the batch file.

Private Attributes

- `std::shared_ptr< std::stringstream > dataStream`
- `std::shared_ptr< parsing::FileData > fileData`

9.1.1 Detailed Description

Creates a batch file from a FileData obeject.

Uses a FileData object to create a string stream, which can then be streamed into a batch file.

See also

[FileData](#)

Definition at line 29 of file [BatchCreator.hpp](#).

9.1.2 Constructor & Destructor Documentation

9.1.2.1 BatchCreator()

```
BatchCreator::BatchCreator (
    std::shared_ptr< parsing::FileData > fileData ) [explicit]
```

Initializes the [BatchCreator](#).

Creates a stringstream and calls the [createBatch\(\)](#) function

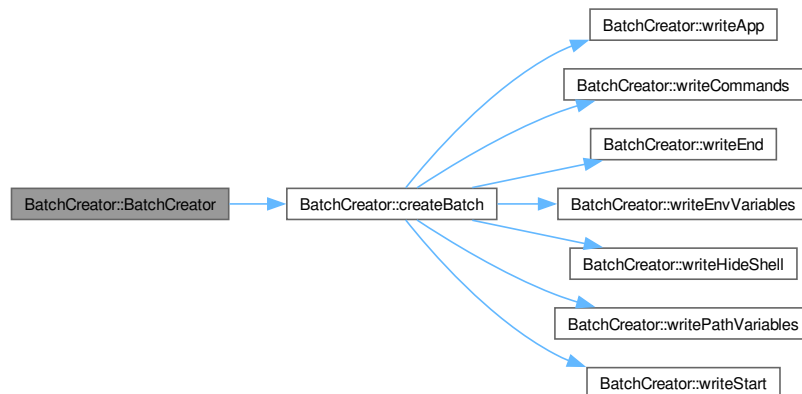

Parameters

<i>fileData</i>	A shared pointer to the FileData object
-----------------	---

Definition at line 18 of file [BatchCreator.cpp](#).

References [createBatch\(\)](#), and [dataStream](#).

Here is the call graph for this function:

9.1.3 Member Function Documentation

9.1.3.1 `createBatch()`

```
void BatchCreator::createBatch ( ) const [private]
```

Creates the batch stream.

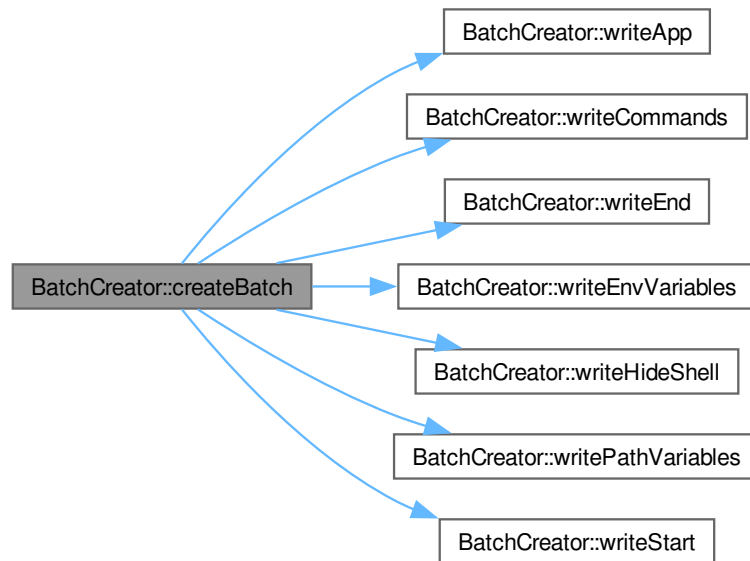

< `FileData` object

The method calls all necessary functions to create the stream for the batch file.

Definition at line 25 of file [BatchCreator.cpp](#).

References [writeApp\(\)](#), [writeCommands\(\)](#), [writeEnd\(\)](#), [writeEnvVariables\(\)](#), [writeHideShell\(\)](#), [writePathVariables\(\)](#), and [writeStart\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

9.1.3.2 `getDataStream()`

```
std::shared_ptr< std::stringstream > BatchCreator::getDataStream ( ) const [inline]
```

Returns the stringstream.

Returns

A shared pointer to the stringstream

Definition at line 46 of file [BatchCreator.hpp](#).

References [dataStream](#).

Here is the caller graph for this function:

9.1.3.3 writeApp()

```
void BatchCreator::writeApp ( ) const [private]
```

If an application is given, it is started at the end.

If the key "application" is given in the json file, the application is started at the end of the batch file.

Definition at line 80 of file [BatchCreator.cpp](#).

References [dataStream](#), and [fileData](#).

Here is the caller graph for this function:

9.1.3.4 writeCommands()

```
void BatchCreator::writeCommands ( ) const [private]
```

Writes the commands to be executed.

Writes the commands to be executed from the FileData object. Those originate from the "commands" entry in the json file

Definition at line 52 of file [BatchCreator.cpp](#).

References [dataStream](#), and [fileData](#).

Here is the caller graph for this function:

9.1.3.5 writeEnd()

```
void BatchCreator::writeEnd ( ) const [private]
```

Writes the end of the batch file.

Writes the end of the batch file, which is always the same:

- @ECHO ON

Definition at line 95 of file [BatchCreator.cpp](#).

References [dataStream](#).

Here is the caller graph for this function:

9.1.3.6 writeEnvVariables()

```
void BatchCreator::writeEnvVariables ( ) const [private]
```

Set's environment variables.

Set's the envirmet variables for the batch. Those originate from the "ENV" entry in the json file with the following syntax:

- Entry under "key" = Entry under "value"

Definition at line 61 of file [BatchCreator.cpp](#).

References [dataStream](#), and [fileData](#).

Here is the caller graph for this function:

9.1.3.7 writeHideShell()

```
void BatchCreator::writeHideShell ( ) const [private]
```

Writes the visibility of the shell.

This hides/shows the shell after the batch file has been executed

Definition at line 41 of file [BatchCreator.cpp](#).

References [dataStream](#), and [fileData](#).

Here is the caller graph for this function:

9.1.3.8 writePathVariables()

```
void BatchCreator::writePathVariables ( ) const [private]
```

Set's the path variables.

Set's the path variables for the batch. Those originate from the "PATH" entry in the json file

Definition at line 69 of file [BatchCreator.cpp](#).

References [dataStream](#), and [fileData](#).

Here is the caller graph for this function:

9.1.3.9 writeStart()

```
void BatchCreator::writeStart ( ) const [private]
```

Writes the start of the batch file.

Writes the start of the batch file, which is always the same:

- setzt ECHO off
- startet cmd.exe

Definition at line 36 of file [BatchCreator.cpp](#).

References [dataStream](#).

Here is the caller graph for this function:

9.1.4 Member Data Documentation

9.1.4.1 dataStream

```
std::shared_ptr<std::stringstream> BatchCreator::dataStream [private]
```

Definition at line 52 of file [BatchCreator.hpp](#).

9.1.4.2 fileData

```
std::shared_ptr<parsing::FileData> BatchCreator::fileData [private]
```

< stringstream for the batch file

Definition at line 54 of file [BatchCreator.hpp](#).

The documentation for this class was generated from the following files:

- src/include/[BatchCreator.hpp](#)
- src/sources/[BatchCreator.cpp](#)

9.2 cli::CommandLineHandler Class Reference

Responsible for the Command Line Interface.

```
#include <CommandLineHandler.hpp>
```

Public Member Functions

- [CommandLineHandler](#) ()=delete
The Constructor of the [CommandLineHandler](#) Class.
- [~CommandLineHandler](#) ()=delete
The Destructor of the [CommandLineHandler](#) Class.

Static Public Member Functions

- static void [printHelp](#) ()
Prints the help message.
- static void [printVersion](#) ()
Prints the version message.
- static void [printCredits](#) ()
Prints the credits message.
- static std::tuple< std::optional< std::string >, std::vector< std::string > > [parseArguments](#) (int argc, char *argv[])
Parses the Command Line Arguments.

9.2.1 Detailed Description

Responsible for the Command Line Interface.

This class is responsible for parsing the command line arguments, printing Help/Version/Credits messages and returning inputted files.

Author

Simon Blum

Date

2024-04-18

Version

0.1.5

9.2.2 Constructor & Destructor Documentation

9.2.2.1 CommandLineHandler()

```
cli::CommandLineHandler::CommandLineHandler ( ) [delete]
```

The Constructor of the [CommandLineHandler](#) Class.

Note

As all functions are static it should not be used and as such is deleted.

9.2.2.2 ~CommandLineHandler()

```
cli::CommandLineHandler::~~CommandLineHandler ( ) [delete]
```

The Destructor of the [CommandLineHandler](#) Class.

Note

As all functions are static it should not be used and as such is deleted.

9.2.3 Member Function Documentation

9.2.3.1 parseArguments()

```
std::tuple< std::optional< std::string >, std::vector< std::string > > cli::CommandLineHandler::parseArguments (
    int argc,
    char * argv[] ) [static]
```

Parses the Command Line Arguments.

This function uses the "getopt.h" library to parse all options given and then returns all files which are given as arguments.

Parameters

<i>argc</i>	The number of arguments given
<i>argv</i>	The arguments given

Returns

Returns a tuple containing the output directory and the files

Definition at line 68 of file [CommandLineHandler.cpp](#).

- std::vector< std::string > [pathValues](#)

9.5.1 Detailed Description

This class contains all data from the json file.

The data from the json file is parsed by the [JsonHandler](#) and then assigned to the attributes of an instance of this class. This class also handles a part of the error handling.

Definition at line 31 of file [FileData.hpp](#).

9.5.2 Member Function Documentation

9.5.2.1 addCommand()

```
void parsing::FileData::addCommand (
    const std::string & command )
```

Adds a given command to this->commands.

Makes sure, that the given command value is not empty and then add's it to the commands attribute.

Parameters

<i>command</i>	The command to be added
----------------	-------------------------

Exceptions

<i>exceptions::InvalidValueException</i>	
--	--

Definition at line 56 of file [FileData.cpp](#).

References [commands](#).

9.5.2.2 addEnvironmentVariable()

```
void parsing::FileData::addEnvironmentVariable (
    const std::string & name,
    const std::string & value )
```

Adds a given tuple to this->environmentVariables.

Makes sure that neither the key nor the value is empty and then adds a tuple with both values to the environment←
Variables attribute

Parameters

<i>name</i>	The name of the env variable
<i>value</i>	The value of the env variable

Exceptions

<i>exceptions::InvalidValueException</i>	
--	--

Definition at line 67 of file [FileData.cpp](#).

References [environmentVariables](#).

9.5.2.3 addPathValue()

```
void parsing::FileData::addPathValue (
    const std::string & pathValue )
```

Add's a given value to this->pathValues.

Makes sure that the given value is not empty and then assigns it to the given pathValues attribute

Parameters

<i>pathValue</i>	The value to be added
------------------	-----------------------

Exceptions

exceptions::InvalidValueException	
---	--

Definition at line 83 of file [FileData.cpp](#).

References [pathValues](#).

9.5.2.4 getApplication()

```
const std::optional< std::string > & parsing::FileData::getApplication ( ) const [inline]
```

Getter for this->application.

Returns

The assigned application

Definition at line 121 of file [FileData.hpp](#).

References [application](#).

9.5.2.5 getCommands()

```
const std::vector< std::string > & parsing::FileData::getCommands ( ) const [inline]
```

Getter for this->commands.

Returns

The vector of assigned commands

Definition at line 129 of file [FileData.hpp](#).

References [commands](#).

9.5.2.6 getEnvironmentVariables()

```
const std::vector< std::tuple< std::string, std::string > > & parsing::FileData::getEnvironmentVariables ( ) const [inline]
```

Getter for this->environmentVariables.

Returns

The vector of assigned env variables

Definition at line 138 of file [FileData.hpp](#).

References [environmentVariables](#).

9.5.2.7 getHideShell()

```
bool parsing::FileData::getHideShell ( ) const [inline]
```

Getter for this->hideShell.

Returns

The assigned value for hideshell

Definition at line 113 of file [FileData.hpp](#).

References [hideShell](#).

9.5.2.8 getOutputFile()

```
const std::string & parsing::FileData::getOutputFile ( ) const [inline]
```

Getter for this->outputfile.

Returns

The assigned outputfile

Definition at line 105 of file [FileData.hpp](#).

References [outputfile](#).

9.5.2.9 getPathValues()

```
const std::vector< std::string > & parsing::FileData::getPathValues ( ) const [inline]
```

Getter for this->pathValues.

Returns

The vector of assigned pathValues

Definition at line 146 of file [FileData.hpp](#).

References [pathValues](#).

9.5.2.10 setApplication()

```
void parsing::FileData::setApplication (
    const std::string & newApplication )
```

Setter for this->application.

Set's the application attribute. Return's if the given string is empty.

Parameters

<i>newApplication</i>	The application to be set
-----------------------	---------------------------

Definition at line 46 of file [FileData.cpp](#).

References [application](#).

9.5.2.11 setHideShell()

```
void parsing::FileData::setHideShell (
    bool newHideShell ) [inline]
```

Setter for this->hideshell.

Parameters

<i>newHideShell</i>	The hideshell value to be set
---------------------	-------------------------------

Definition at line 49 of file [FileData.hpp](#).

References [hideShell](#).

9.5.2.12 setOutputFile()

```
void parsing::FileData::setOutputFile (
    std::string & newOutputfile )
```

Setter for this->outputfile.

Checks that neither the given string is empty, nor that the outputfile is already set and then assigns the newOutputfile to the instance.

Parameters

<i>newOutputfile</i>	The outputfile to be set
----------------------	--------------------------

Exceptions

exceptions::InvalidValueException	
---	--

Definition at line 18 of file [FileData.cpp](#).

References [outputfile](#).

9.10 parsing::JsonHandler Class Reference

This file reads all data from the json file.

```
#include <JsonHandler.hpp>
```

Public Member Functions

- [JsonHandler](#) ()
Constructor without arguments.
- [JsonHandler](#) (const std::string &filename)
The constructor.
- std::shared_ptr< [FileData](#) > [getFileData](#) ()
Retrieve the data from the json file.

Private Member Functions

- void [assignOutputFile](#) () const
Assigns the outputfile to this->data.
- void [assignHideShell](#) () const
Assigns the hideshow value to this->data.
- void [assignApplication](#) () const
Assigns application to this->data.
- void [assignEntries](#) () const
Assigns entries to this->data.
- void [assignCommand](#) (const Json::Value &entry) const
Assigns an command to this->data.
- void [assignEnvironmentVariable](#) (const Json::Value &entry) const
Assigns an environmentVariable to this->data.
- void [assignPathValue](#) (const Json::Value &entry) const
Assigns a path value to this->data.
- std::shared_ptr< [FileData](#) > [createFileData](#) ()
Creates the [FileData](#) instance.

Static Private Member Functions

- static std::shared_ptr< Json::Value > [parseFile](#) (const std::string &filename)
Parses the given json file.

Private Attributes

- std::shared_ptr< Json::Value > [root](#)
- std::shared_ptr< [FileData](#) > [data](#)

9.10.1 Detailed Description

This file reads all data from the json file.

This file uses the jsoncpp library to parse all data from a json file, validate it to some degree.

See also

<https://github.com/open-source-parsers/jsoncpp>

Definition at line 47 of file [JsonHandler.hpp](#).

9.10.2 Constructor & Destructor Documentation

9.10.2.1 JsonHandler() [1/2]

```
parsing::JsonHandler::JsonHandler ( ) [inline]
```

Constructor without arguments.

This constructor can be used to initialise an instance in an outer scope and then assign it values from an inner scope.

Definition at line 55 of file [JsonHandler.hpp](#).

9.10.2.2 JsonHandler() [2/2]

```
parsing::JsonHandler::JsonHandler (
    const std::string & filename ) [explicit]
```

The constructor.

This constructor calls this->[parseFile\(\)](#) when called.

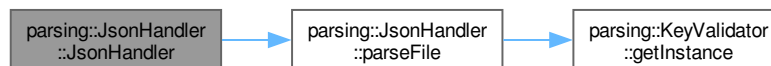

Parameters

<i>filename</i>	Name of the json file
-----------------	-----------------------

Definition at line 20 of file [JsonHandler.cpp](#).

References [parseFile\(\)](#), and [root](#).

Here is the call graph for this function:

9.10.3 Member Function Documentation

9.10.3.1 assignApplication()

```
void parsing::JsonHandler::assignApplication ( ) const [private]
```

Assigns application to this->data.

Retrieves the value of the application key from `Json::Value` this->root and defaults to an empty string.

Definition at line 75 of file [JsonHandler.cpp](#).

References [data](#), and [root](#).

Here is the caller graph for this function:

9.10.3.2 assignCommand()

```
void parsing::JsonHandler::assignCommand (
    const Json::Value & entry ) const [private]
```

Assigns an command to this->data.

Parameters

<i>entry</i>	The entry with the command
--------------	----------------------------

Definition at line 107 of file [JsonHandler.cpp](#).

References [data](#).

Here is the caller graph for this function:

9.10.3.3 assignEntries()

```
void parsing::JsonHandler::assignEntries ( ) const [private]
```

Assigns entries to this->data.

Goes through each of the entries from `Json::Value this->root` and calls the relevant method depending on it's type. All "type" keys should be valid by this point.

Parameters

<i>entry</i>	Json::Value containing an array with entries
--------------	--

Exceptions

<code>exceptions::UnreachableCodeException</code>	
---	--

Definition at line 80 of file [JsonHandler.cpp](#).

References [assignCommand\(\)](#), [assignEnvironmentVariable\(\)](#), [assignPathValue\(\)](#), and [root](#).

Here is the call graph for this function:

Here is the caller graph for this function:

9.10.3.4 assignEnvironmentVariable()

```
void parsing::JsonHandler::assignEnvironmentVariable (
    const Json::Value & entry ) const [private]
```

Assigns an environmentVariable to this->data.

Parameters

<i>entry</i>	The entry with the environmentVariable
--------------	--

Definition at line 112 of file [JsonHandler.cpp](#).

References [data](#).

Here is the caller graph for this function:

9.10.3.5 assignHideShell()

```
void parsing::JsonHandler::assignHideShell ( ) const [private]
```

Assigns the hideshow value to this->data.

Retrieves the value of the hideshow key from Json::Value this->root and defaults to negative.

Definition at line 69 of file [JsonHandler.cpp](#).

References [data](#), and [root](#).

Here is the caller graph for this function:

9.10.3.6 assignOutputFile()

```
void parsing::JsonHandler::assignOutputFile ( ) const [private]
```

Assigns the outputfile to this->data.

Retrieves the outputfile from Json::Value this->root and makes sure, that the file doesn't already exist.

Exceptions

exceptions::FileExistsException	
---	--

Definition at line 63 of file [JsonHandler.cpp](#).

References [data](#), and [root](#).

Here is the caller graph for this function:

9.10.3.7 assignPathValue()

```
void parsing::JsonHandler::assignPathValue (
    const Json::Value & entry ) const [private]
```

Assigns a path value to this->data.

Parameters

<i>entry</i>	The entry with the path value
--------------	-------------------------------

Definition at line 119 of file [JsonHandler.cpp](#).

References [data](#).

Here is the caller graph for this function:

9.10.3.8 createFileData()

```
std::shared_ptr< FileData > parsing::JsonHandler::createFileData ( ) [private]
```

Creates the [FileData](#) instance.

Instantiates the [FileData](#) instance, calls all nessecary functions and returns a shared pointer to it.

Returns

Pointer to the created instance of [FileData](#)

Definition at line 53 of file [JsonHandler.cpp](#).

References [assignApplication\(\)](#), [assignEntries\(\)](#), [assignHideShell\(\)](#), [assignOutputFile\(\)](#), and [data](#).

Here is the call graph for this function:

Here is the caller graph for this function:

9.10.3.9 getFileData()

```
std::shared_ptr< FileData > parsing::JsonHandler::getFileData ( )
```

Retrieve the data from the json file.

This method calls this->[createFileData\(\)](#) needed to retrieve the values from the `Json::Value` this->root and then returns a shared pointer to the created `FileData` object.

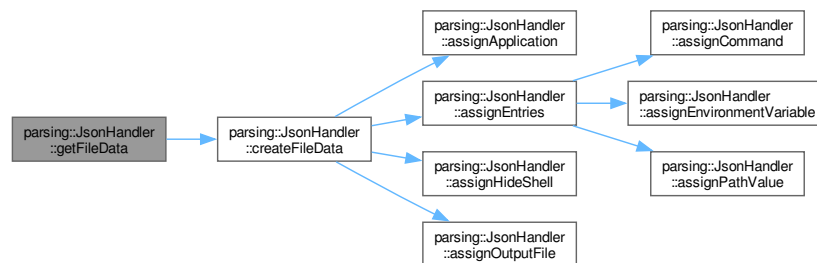

Returns

Pointer to the `FileData` Object with the parsed data from json

Definition at line 48 of file `JsonHandler.cpp`.

References [createFileData\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

9.10.3.10 parseFile()

```
std::shared_ptr< Json::Value > parsing::JsonHandler::parseFile (
    const std::string & filename ) [static], [private]
```

Parses the given json file.

This method first creates a new `Json::Value` instance and then tries to parse the given json file. It then validates the keys of the instance using the `KeyValidator` class.

Parameters

<i>filename</i>	The name of the file wich should be parsed
-----------------	--

Returns

A shared pointer to the Json::Value instance

See also

[KeyValidator::validateKeys\(\)](#)

Exceptions

exceptions::ParsingException	
exceptions::InvalidKeyException	

Definition at line 25 of file [JsonHandler.cpp](#).

References [parsing::KeyValidator::getInstance\(\)](#).

9.10.4 Member Data Documentation

9.10.4.1 data

```
std::shared_ptr<FileData> parsing::JsonHandler::data [private]
```

Definition at line 155 of file [JsonHandler.hpp](#).

9.10.4.2 root

```
std::shared_ptr<Json::Value> parsing::JsonHandler::root [private]
```

Definition at line 154 of file [JsonHandler.hpp](#).

The documentation for this class was generated from the following files:

- [src/include/JsonHandler.hpp](#)
- [src/sources/JsonHandler.cpp](#)

9.11 parsing::KeyValidator Class Reference

Validates keys of a `Json::Value` object.

```
#include <KeyValidator.hpp>
```

Public Member Functions

- `std::vector< std::tuple< int, std::string > >` [validateKeys](#) (const `Json::Value` &root, const `std::string` &filename)
Validate keys off a `Json::Value` object.

Static Public Member Functions

- static [KeyValidator](#) & [getInstance](#) ()
Get the instance of this class.

Private Member Functions

- `std::vector< std::tuple< int, std::string > >` [getWrongKeys](#) (const `Json::Value` &root, const `std::string` &filename) const
Retrieve the wrong keys from a `Json::Value` object.
- void [validateTypes](#) (const `std::string` &filename, const `Json::Value` &entry, const `std::unordered_set< std::string >` &entryKeys)
Validates types from the entries array.
- `std::vector< std::tuple< int, std::string > >` [validateEntries](#) (const `std::string` &filename, const `std::unordered_set< std::string >` &entryKeys) const
Validates that keys within the entries array are valid.

Static Private Member Functions

- static `std::optional< int >` [getUnknownKeyLine](#) (const `std::string` &filename, const `std::string` &wrongKey)
Get the line of an unknown key.

Private Attributes

- `std::unordered_set< std::string >` [validKeys](#)
- `std::unordered_set< std::string >` [validEntryKeys](#)
- `std::unordered_map< std::string_view, std::vector< std::string > >` [typeToKeys](#)

9.11.1 Detailed Description

Validates keys of a `Json::Value` object.

This class is singleton. That way when multiple files are parsed with the application, the maps for valid keys and the set for the type entries field only have to be allocated once when parsing multiple files.

Definition at line 30 of file [KeyValidator.hpp](#).

9.11.2 Member Function Documentation

9.11.2.1 getInstance()

```
KeyValidator & parsing::KeyValidator::getInstance ( ) [static]
```

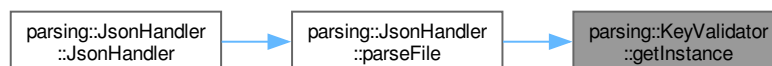

Get the instance of this class.

Returns

Reference to the instance of this class

Definition at line 20 of file [KeyValidator.cpp](#).

Here is the caller graph for this function:

9.11.2.2 getUnknownKeyLine()

```
std::optional< int > parsing::KeyValidator::getUnknownKeyLine (
    const std::string & filename,
    const std::string & wrongKey ) [static], [private]
```

Get the line of an unknown key.

This method goes through each line of the given file and checks if the line contains the given key. Returns `std::nullopt` if the file can't be opened or the key was not found.

Parameters

<i>filename</i>	The filename which should contain the key
<i>wrongKey</i>	The key to be searched for

Returns

The line of the key, if it was found

Definition at line 124 of file [KeyValidator.cpp](#).

Here is the caller graph for this function:

9.11.2.3 getWrongKeys()

```
std::vector< std::tuple< int, std::string > > parsing::KeyValidator::getWrongKeys (
    const Json::Value & root,
    const std::string & filename ) const [private]
```

Retrieve the wrong keys from a `Json::Value` object.

This method goes through each key of the `Json::Value` object and makes sure it's valid.

Parameters

<i>root</i>	The <code>Json::Value</code> object to be validated.
<i>filename</i>	The filename from which 'root' is from.

Returns

A vector with tuples, containing the line and name of invalid types.

Definition at line 49 of file [KeyValidator.cpp](#).

References [getUnknownKeyLine\(\)](#), and [validKeys](#).

Here is the call graph for this function:

Here is the caller graph for this function:

9.11.2.4 validateEntries()

```
std::vector< std::tuple< int, std::string > > parsing::KeyValidator::validateEntries (
    const std::string & filename,
    const std::unordered_set< std::string > & entryKeys ) const [private]
```

Validates that keys within the entries array are valid.

This method goes through each of the entries, and validates, that the keys are part of the `validEntryKeys` attribute.

Parameters

<i>filename</i>	The filename from which the entries are from
<i>entryKeys</i>	The keys of the entries

Returns

A vector with tuples, containing the line and name of invalid entry keys

Definition at line 71 of file [KeyValidator.cpp](#).

References [getUnknownKeyLine\(\)](#), and [validEntryKeys](#).

Here is the call graph for this function:

Here is the caller graph for this function:

9.11.2.5 validateKeys()

```
std::vector< std::tuple< int, std::string > > parsing::KeyValidator::validateKeys (
    const Json::Value & root,
    const std::string & filename )
```

Validate keys off a `Json::Value` object.

This method goes through the `MemberNames` of a `Json::Value` object and validates, that they are part of the valid↵ Key attribute. It calls the nessecary methods to validate the keys within the entries array.

Parameters

<i>root</i>	The <code>Json::Value</code> object to be validated.
<i>filename</i>	The filename from which 'root' is from.

Returns

A vector with tuples, containing the line and name of invalid types.

Definition at line 26 of file [KeyValidator.cpp](#).

References [getWrongKeys\(\)](#), [validateEntries\(\)](#), and [validateTypes\(\)](#).

Here is the call graph for this function:

9.11.2.6 validateTypes()

```
void parsing::KeyValidator::validateTypes (
    const std::string & filename,
    const Json::Value & entry,
    const std::unordered_set< std::string > & entryKeys ) [private]
```

Validates types from the entries array.

This method goes makes sure, that the type of the given entry is valid and that it contains it's necessary keys. It will throw an exception if the type is missing, if the type is invalid or if the type is missing a key.

Note

Unnecessary keys within a type entry, don't cause an exception and are ignored.

Parameters

<i>filename</i>	The filename from which 'entry' is from
<i>entry</i>	The entry to be validated
<i>entryKeys</i>	The keys of the entry

Exceptions

<i>exceptions::MissingTypeException</i>	
<i>exceptions::InvalidTypeException</i>	
<i>exceptions::MissingKeyException</i>	

Definition at line 92 of file [KeyValidator.cpp](#).

References [getUnknownKeyLine\(\)](#), and [typeToKeys](#).

Here is the call graph for this function:

Here is the caller graph for this function:

9.11.3 Member Data Documentation

9.11.3.1 typeToKeys

```
std::unordered_map<std::string_view, std::vector<std::string> > parsing::KeyValidator::typeToKeys [private]
```

Initial value:

```
= {
    {"EXE", {"command"}}, {"PATH", {"path"}}, {"ENV", {"key", "value"}}
}
```

Note

Changed from if/else clause within function to map in 0.2.1

Definition at line 144 of file [KeyValidator.hpp](#).

9.11.3.2 validEntryKeys

```
std::unordered_set<std::string> parsing::KeyValidator::validEntryKeys [private]
```

Initial value:

```
= { "type", "key", "value",
    "path", "command"
}
```

Note

Changed from vector to unordered_set in 0.2.1 - as this should improve lookup performance from O(n) to O(1)

Definition at line 137 of file [KeyValidator.hpp](#).

9.11.3.3 validKeys

```
std::unordered_set<std::string> parsing::KeyValidator::validKeys [private]
```

Initial value:

```
= { "outputfile", "hideshell",  
    "entries", "application"  
}
```

Note

Changed from vector to unordered_set in 0.2.1 - as this should improve lookup performance from O(n) to O(1)

Definition at line 130 of file [KeyValidator.hpp](#).

The documentation for this class was generated from the following files:

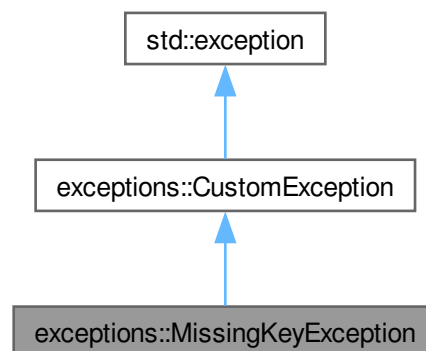

- [src/include/KeyValidator.hpp](#)

9.18 utilities::Utils Class Reference

Responsible for utility function.

```
#include <Utils.hpp>
```

Static Public Member Functions

- static void [setupEasyLogging](#) (const std::string &configFile)
Set up easylogging.
- static bool [handleParseException](#) (const [exceptions::CustomException](#) &e, const std::vector< std::string >↵
::iterator &file, const std::vector< std::string > &files)
Handle an exception within the main parsing loop.
- static bool [askToContinue](#) (const std::string &prompt="Do you want to continue? (Y/N)\n")
Asks if the user wants to continue.
- static void [checkConfigFile](#) (const std::string &configFile)
Checks if the easylogging-config file exists.
- static const std::string & [checkDirectory](#) (std::string &directory)
Checks if the given directory exists and is valid.

9.18.1 Detailed Description

Responsible for utility function.

This class is responsible for handling miscellaneous utility functions which be used throughout the whole project.

Definition at line 42 of file [Utils.hpp](#).

9.18.2 Member Function Documentation

9.18.2.1 askToContinue()

```
bool utilities::Utils::askToContinue (
    const std::string & prompt = "Do you want to continue? (Y/N)\n" ) [static]
```

Asks if the user wants to continue.

Asks the user if they want to continue and prompts them for a response.

Parameters

<i>prompt</i>	(Optional) A custom prompt to be used.
---------------	--

Returns

Returns true if the user wants to continue and false otherwise.

Definition at line 34 of file [Utils.cpp](#).

Here is the caller graph for this function:

9.18.2.2 checkConfigFile()

```
void utilities::Utils::checkConfigFile (
    const std::string & configFile ) [static]
```

Checks if the easylogging-config file exists.

Parameters

<i>configFile</i>	The config file to be checked
-------------------	-------------------------------

Definition at line 55 of file [Utils.cpp](#).

Here is the caller graph for this function:

9.18.2.3 checkDirectory()

```
const std::string & utilities::Utils::checkDirectory (
    std::string & directory ) [static]
```

Checks if the given directory exists and is valid.

This function checks if the given directory exists and is valid. If the directory does not end with a '/' or a '\', it will be added.

Parameters

<i>directory</i>	The directory to be checked
------------------	-----------------------------

Returns

The checked directory

Definition at line 65 of file [Utils.cpp](#).

Here is the caller graph for this function:

9.18.2.4 handleParseException()

```
bool utilities::Utils::handleParseException (
    const exceptions::CustomException & e,
    const std::vector< std::string >::iterator & file,
    const std::vector< std::string > & files ) [static]
```

Handle an exception within the main parsing loop.

This function handles an exception within the main parsing loop. It displays the error message and asks the user if they want to continue.

- Moved to [Utils](#) in 0.2.2 to improve readability in [main.cpp](#)

Parameters

<i>e</i>	The exception to be handled
<i>file</i>	The file which caused the exception
<i>files</i>	The list of files

Returns

Returns true if the user wants to continue and false otherwise

Definition at line 77 of file [Utils.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**9.18.2.5 setupEasyLogging()**

```
void utilities::Utils::setupEasyLogging (
    const std::string & configFile ) [static]
```

Set up easylogging.

This function sets up the easylogging library based on the given config file.

Parameters

<i>configFile</i>	The config file which is used
-------------------	-------------------------------

Definition at line 25 of file [Utils.cpp](#).

References [config::HOMEPAGE_URL](#), [config::MAJOR_VERSION](#), [config::MINOR_VERSION](#), [config::PATCH_VERSION](#), and [config::PROJECT_NAME](#).

Here is the caller graph for this function:

The documentation for this class was generated from the following files:

10.8 src/include/Exceptions.hpp File Reference

Contains all the custom exceptions used in the project.

```
#include "LoggingWrapper.hpp"
```

```
#include "config.hpp"
```

```
#include <string>
```

Include dependency graph for Exceptions.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class [exceptions::CustomException](#)
Base class for all custom exceptions.
- class [exceptions::ParsingException](#)
Exception for syntax errors within the json file.
- class [exceptions::FileExistsException](#)
Exception for an already existing outputfile.
- class [exceptions::InvalidValueException](#)
Exception for an invalid (usually empty) value field.
- class [exceptions::InvalidKeyException](#)
Exception for invalid keys.
- class [exceptions::InvalidTypeException](#)
Exception for invalid types.
- class [exceptions::MissingKeyException](#)
Exception for missing keys within entries.
- class [exceptions::MissingTypeException](#)
Exception for missing types of entries.
- class [exceptions::UnreachableCodeException](#)
Exception for when the application reaches code it shouldn't reach.
- class [exceptions::FailedToOpenFileException](#)
Exception for when a file can't be opened.
- class [exceptions::NoSuchDirException](#)
Exception for when a directory does not exist.

Namespaces

- namespace [exceptions](#)
Namespace used for customized exceptions.

10.8.1 Detailed Description

Contains all the custom exceptions used in the project.

Author

Simon Blum

Date

2024-04-26

Version

0.2.2

The error handling within this project is exception based. This allows us to throw custom exceptions throughout any part of the process and allow us to deal with them when necessary.

10.18.2 Function Documentation

10.18.2.1 main()

```
int main (  
    int argc,  
    char * argv[] )
```

Main function of the program.

The main function is responsible for connection all parts of the programm. It calls all relevant classes and finishes when everything is done.

Parameters

<i>argc</i>	The number of arguments given
<i>argv</i>	The command line arguments given

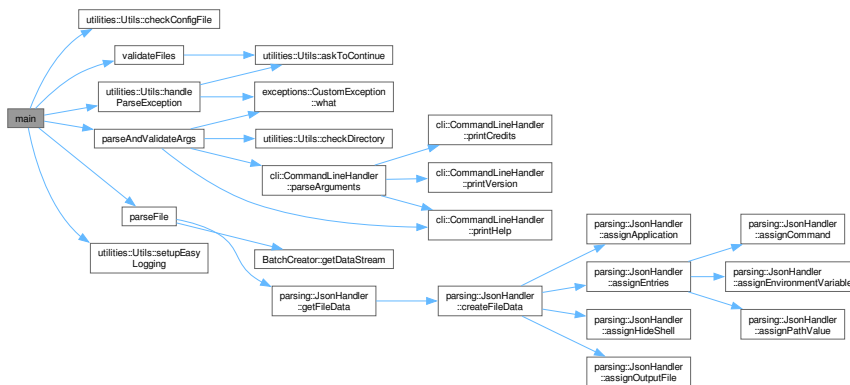

Returns

Returns 0 on success, 1 on failure

Definition at line 67 of file [main.cpp](#).

References [utilities::Utils::checkConfigFile\(\)](#), [utilities::Utils::handleParseException\(\)](#), [config::LOG_CONFIG](#), [parseAndValidateArgs\(\)](#), [parseFile\(\)](#), [utilities::Utils::setupEasyLogging\(\)](#), and [validateFiles\(\)](#).

Here is the call graph for this function:

10.18.2.2 parseAndValidateArgs()

```

std::tuple< std::vector< std::string >, std::string > parseAndValidateArgs (
    int argc,
    char * argv[ ] )
  
```

Validates and parses arguments.

Parameters

<i>argc</i>	Number of arguments provided
<i>argv</i>	The arguments provided

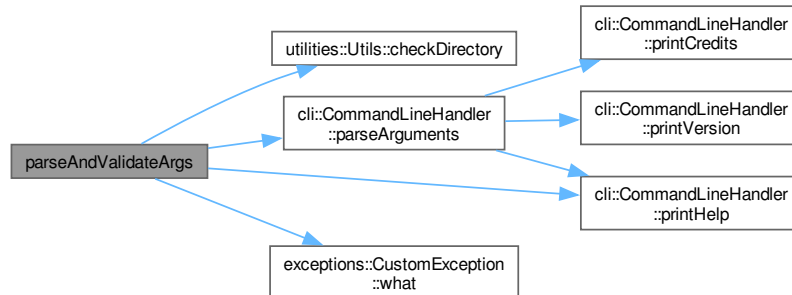

Returns

A tuple containing the files to be parsed and the output directory

Definition at line 103 of file [main.cpp](#).

References [utilities::Utils::checkDirectory\(\)](#), [cli::CommandLineHandler::parseArguments\(\)](#), [cli::CommandLineHandler::printHelp\(\)](#), and [exceptions::CustomException::what\(\)](#).

10.18.2.3 parseFile()

```

void parseFile (
    const std::string & file,
    const std::string & outputDirectory )
  
```

Parses the given file and writes the output to the output directory.

Creates the Batch file from the given file

Parameters

<i>file</i>	The file to be parsed
-------------	-----------------------

Definition at line 170 of file [main.cpp](#).

References [BatchCreator::getDataStream\(\)](#), and [parsing::JsonHandler::getFileData\(\)](#).

Here is the caller graph for this function:

10.18.2.4 validateFiles()

```
std::vector< std::string > validateFiles (
    const std::vector< std::string > & files )
```

Checks if the files are valid.

Makes sures, that provided files exists and checks their file ending

Parameters

<i>files</i>	The files to be checked
--------------	-------------------------

Returns

A vector containing the valid files

Definition at line 130 of file [main.cpp](#).
