## JSON2Batch

*This file is autogenerated. Changes will be overwritten*

### 1.1 JSON2Batch

**Todo** Update [README.md](#)

Beschreibung: A simple tool to convert json to batch.

Version: 0.2.1

Autoren: Elena Schwarzbach, Max Rodler, Simon Blum, Sonia Sinaci

Documentation: <https://definitelynotsimon13.github.io/ProjectJsonToBat>

#### Aktueller Plan:

- Verantwortlichkeiten zugewiesen
- "Sprint" bis ?

#### Verantwortlichkeiten:

- [CMake](#) &#8594 Simon
- [JsonParsing](#) &#8594 Elena und Sonia
- [Batch Creation](#) &#8594 Max
- [CLI](#) &#8594 Simon

#### Andere Arbeitspakete

- Error Handling
- Unit Tests
- Code Quality
- Documentation

#### Bezüglich Code Quality

- Kein using namespace

- Nur main im Global Namespace

### Wichtige Commands

Branch wechseln

- git checkout -b NEUERBRANCH Pushen
- git push origin zum pullen
- git pull --prune

### Kurze Doxygen Übersicht

**Achtung:** Die Leerzeichen zwischen @ und dem Wort dürfen nicht in den Code, sind nur da, damit Doxygen die nicht aufnimmt! /\*\*

- @ brief Kurze Beschreibung
- @ details Längere
- @ todo
- @ bug
- @ param PARAMETERNAME was der macht
- @ return was die funktion return
- @ throws \*\*/

# Chapter 3

## Topic Index

### 3.1 Topics

Here is a list of all topics with brief descriptions:

StyleHelpers . . . . .	15
------------------------	----

## Chapter 4

# Namespace Index

### 4.1 Namespace List

Here is a list of all namespaces with brief descriptions:

<a href="#">cli</a>	Includes everything regarding the CLI . . . . .	17
<a href="#">exceptions</a>	Namespace used for customized exceptions . . . . .	18
<a href="#">parsing</a>	The namespace containing everything relevant to parsing . . . . .	19
<a href="#">utilities</a>	Includes all utilities . . . . .	19

## Chapter 5

# Hierarchical Index

### 5.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

BatchCreator . . . . .	21
cli::CommandLineHandler . . . . .	26
std::exception	
exceptions::CustomException . . . . .	31
exceptions::FailedToOpenFileException . . . . .	33
exceptions::FileExistsException . . . . .	41
exceptions::InvalidKeyException . . . . .	43
exceptions::InvalidTypeException . . . . .	45
exceptions::InvalidValueException . . . . .	47
exceptions::MissingKeyException . . . . .	65
exceptions::MissingTypeException . . . . .	68
exceptions::ParsingException . . . . .	70
exceptions::UnreachableCodeException . . . . .	72
parsing::FileData . . . . .	35
parsing::JsonHandler . . . . .	49
parsing::KeyValidator . . . . .	58
options . . . . .	70
utilities::Utils . . . . .	74

# Chapter 6

## Class Index

### 6.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">BatchCreator</a>	
Erstellt Batch Datei . . . . .	21
<a href="#">cli::CommandLineHandler</a>	
Responsible for the Command Line Interface . . . . .	26
<a href="#">exceptions::CustomException</a>	
Base class for all custom exceptions . . . . .	31
<a href="#">exceptions::FailedToOpenFileException</a>	
. . . . .	33
<a href="#">parsing::FileData</a>	
This class contains all data from the json file . . . . .	35
<a href="#">exceptions::FileExistsException</a>	
Exception for an already existing outputfile . . . . .	41
<a href="#">exceptions::InvalidKeyException</a>	
Exception for invalid keys . . . . .	43
<a href="#">exceptions::InvalidTypeException</a>	
Exception for invalid types . . . . .	45
<a href="#">exceptions::InvalidValueException</a>	
Exception for an invalid (usually empty) value field . . . . .	47
<a href="#">parsing::JsonHandler</a>	
This file reads all data from the json file . . . . .	49
<a href="#">parsing::KeyValidator</a>	
Validates keys of a Json::Value object . . . . .	58
<a href="#">exceptions::MissingKeyException</a>	
Exception for missing keys within entries . . . . .	65
<a href="#">exceptions::MissingTypeException</a>	
Exception for missing types of entries . . . . .	68
<a href="#">options</a>	
The struct containing all possible options . . . . .	70
<a href="#">exceptions::ParsingException</a>	
Exception for syntax errors within the json file . . . . .	70
<a href="#">exceptions::UnreachableCodeException</a>	
Exception for when the application reaches code it shouldn't reach . . . . .	72
<a href="#">utilities::Utils</a>	
Responsible for utility function . . . . .	74

# Chapter 7

## File Index

### 7.1 File List

Here is a list of all files with brief descriptions:

src/main.cpp	
Contains the main function . . . . .	97
src/include/BatchCreator.hpp	
Creates batch file . . . . .	79
src/include/CommandLineHandler.hpp	
Responsible for the Command Line Interface . . . . .	81
src/include/config.hpp	
Configures general project information . . . . .	83
src/include/Exceptions.hpp	
Contains all the custom exceptions used in the project . . . . .	86
src/include/FileData.hpp	
This file contains the FileData class . . . . .	90
src/include/JsonHandler.hpp	
This file contains the JsonHandler class . . . . .	92
src/include/KeyValidator.hpp	
This file contains the KeyValidator class . . . . .	94
src/include/Utils.hpp	
. . . . .	96
src/sources/BatchCreator.cpp	
. . . . .	103
src/sources/CommandLineHandler.cpp	
Implementation for the Command Line Interface . . . . .	104
src/sources/FileData.cpp	
. . . . .	107
src/sources/JsonHandler.cpp	
. . . . .	109
src/sources/KeyValidator.cpp	
. . . . .	111
src/sources/Utils.cpp	
Implementation for the Utils class . . . . .	115

## Chapter 8

# Topic Documentation

### 8.1 StyleHelpers

Static variables to help with CLI styling.

Static variables to help with CLI styling.

A group of strings, that use escape sequences to easily style the command line interface on Unix systems. When compiling for Windows all of these strings will be empty, as escape sequences can't be used the same way.

## Chapter 9

# Namespace Documentation

### 9.1 cli Namespace Reference

Includes everything regarding the CLI.

#### Classes

- class [CommandLineHandler](#)  
*Responsible for the Command Line Interface.*

#### Variables

- static const struct option [options](#) []

#### 9.1.1 Detailed Description

Includes everything regarding the CLI.

This namespace includes all the code regarding the Command Line Interface. This includes the [CommandLineHandler](#) Class, the struct for the options and helpers for Styling.

#### See also

[CommandLineHandler](#)  
[options](#)  
[StyleHelpers](#)

## 9.1.2 Variable Documentation

### 9.1.2.1 options

```
const struct option cli::options[] [static]
```

Initial value:

```
= {  
    {"help", no_argument, nullptr, 'h'},  
    {"version", no_argument, nullptr, 'V'},  
    {"credits", no_argument, nullptr, 'c'},  
    {"verbose", no_argument, nullptr, 0},  
    nullptr  
}
```

Definition at line 112 of file [CommandLineHandler.hpp](#).

## 9.2 exceptions Namespace Reference

Namespace used for customized exceptions.

### Classes

- class [CustomException](#)  
*Base class for all custom exceptions.*
- class [FailedToOpenFileException](#)
- class [FileExistsException](#)  
*Exception for an already existing outputfile.*
- class [InvalidKeyException](#)  
*Exception for invalid keys.*
- class [InvalidTypeException](#)  
*Exception for invalid types.*
- class [InvalidValueException](#)  
*Exception for an invalid (usually empty) value field.*
- class [MissingKeyException](#)  
*Exception for missing keys within entries.*
- class [MissingTypeException](#)  
*Exception for missing types of entries.*
- class [ParsingException](#)  
*Exception for syntax errors within the json file.*
- class [UnreachableCodeException](#)  
*Exception for when the application reaches code it shouldn't reach.*

### 9.2.1 Detailed Description

Namespace used for customized exceptions.

## 9.3 parsing Namespace Reference

The namespace containing everything relevant to parsing.

### Classes

- class [FileData](#)  
*This class contains all data from the json file.*
- class [JsonHandler](#)  
*This file reads all data from the json file.*
- class [KeyValidator](#)  
*Validates keys of a `Json::Value` object.*

### 9.3.1 Detailed Description

The namespace containing everything relevant to parsing.

This namespace contains all relevant classes to parsing the json file and creating the batch output.

See also

[JsonHandler](#)  
[FileData](#)  
[KeyValidator](#)  
[BatchCreator](#)

## 9.4 utilities Namespace Reference

Includes all utilities.

### Classes

- class [Utils](#)  
*Responsible for utility function.*

### 9.4.1 Detailed Description

Includes all utilities.

This namespace includes the utility class with utility functions which can be used throughout the project.

See also

[Utils](#)

# Chapter 10

## Class Documentation

### 10.1 BatchCreator Class Reference

Erstellt Batch Datei.

```
#include <BatchCreator.hpp>
```

#### Public Member Functions

- [BatchCreator](#) (std::shared\_ptr< [parsing::FileData](#) > [fileData](#))  
*Initialisiert [BatchCreator](#).*

#### Private Member Functions

- void [createBatch](#) ()  
*Setzt batch Datei zusammen.*
- void [writeStart](#) ()  
*Anfang der Batch Datei.*
- void [writeHideShell](#) ()  
*Sichtbarkeit Konsole.*
- void [writeCommands](#) ()  
*Befehle ausführen.*
- void [writeEnvVariables](#) ()  
*Umgebungsvariablen setzen.*
- void [writePathVariables](#) ()  
*Pfade setzen.*
- void [writeApp](#) ()  
*Öffnet Anwendung falls gewünscht.*
- void [writeEnd](#) ()  
*Ende der Batch Datei.*

#### Private Attributes

- std::ofstream [batchFile](#)
- std::shared\_ptr< [parsing::FileData](#) > [fileData](#)

### 10.1.1 Detailed Description

Erstellt Batch Datei.

Wandelt Elemente aus JSON-Datei in Batch-Format um

See also

Definition at line 24 of file [BatchCreator.hpp](#).

### 10.1.2 Constructor & Destructor Documentation

#### 10.1.2.1 BatchCreator()

```
BatchCreator::BatchCreator (
    std::shared_ptr< parsing::FileData > fileData )
```

Initialisiert [BatchCreator](#).

Parameters

<i>filename</i>	
-----------------	--

Definition at line 16 of file [BatchCreator.cpp](#).

References [createBatch\(\)](#), and [fileData](#).

Here is the call graph for this function:

### 10.1.3 Member Function Documentation

#### 10.1.3.1 createBatch()

```
void BatchCreator::createBatch ( ) [private]
```

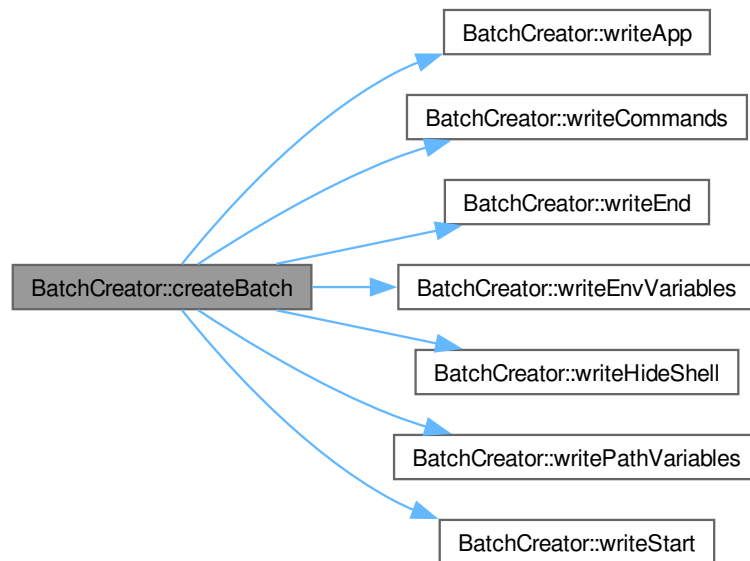

Setzt batch Datei zusammen.

Beinhaltet Aufrufe der einzelnen Komponenten der batch Datei

Definition at line 22 of file [BatchCreator.cpp](#).

References [batchFile](#), [fileData](#), [writeApp\(\)](#), [writeCommands\(\)](#), [writeEnd\(\)](#), [writeEnvVariables\(\)](#), [writeHideShell\(\)](#), [writePathVariables\(\)](#), and [writeStart\(\)](#).

Here is the call graph for this function:

### 10.2.2 Constructor & Destructor Documentation

#### 10.2.2.1 CommandLineHandler()

```
cli::CommandLineHandler::CommandLineHandler ( ) [delete]
```

The Constructor of the [CommandLineHandler](#) Class.

#### Note

As all functions are static it should not be used and as such is private.

### 10.2.2.2 ~CommandLineHandler()

```
cli::CommandLineHandler::~~CommandLineHandler ( ) [delete]
```

The Destructor of the [CommandLineHandler](#) Class.

#### Note

As all functions are static it should not be used and as such is private.

## 10.2.3 Member Function Documentation

### 10.2.3.1 parseArguments()

```
std::vector< std::string > cli::CommandLineHandler::parseArguments (
    int argc,
    char * argv[] ) [static]
```

Parses the Command Line Arguments.

This function uses the "getopt.h" library to parse all options given and then returns all files which are given as arguments.

#### Parameters

<i>argc</i>	The number of arguments given
<i>argv</i>	The arguments given

#### Exceptions

<i>std::logic_error</i>	
-------------------------	--

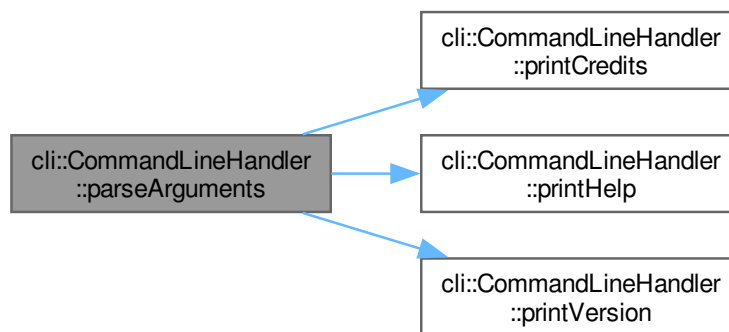

#### Returns

Returns a vector of strings containing all filenames.

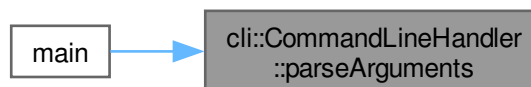

Definition at line 66 of file [CommandLineHandler.cpp](#).

### 10.5.1 Detailed Description

This class contains all data from the json file.

The data from the json file is parsed by the [JsonHandler](#) and then assigned to the attributes of an instance of this class. This class also handles a part of the error handling.

Definition at line 30 of file [FileData.hpp](#).

## 10.5.2 Member Function Documentation

### 10.5.2.1 addCommand()

```
void parsing::FileData::addCommand (
    const std::string & command )
```

Adds a given command to this->commands.

Makes sure, that the given command value is not empty and then add's it to the commands attribute.

#### Parameters

<i>command</i>	The command to be added
----------------	-------------------------

#### Exceptions

<a href="#">exceptions::InvalidValueException</a>	
---	--

Definition at line 55 of file [FileData.cpp](#).

References [commands](#).

### 10.5.2.2 addEnvironmentVariable()

```
void parsing::FileData::addEnvironmentVariable (
    const std::string & name,
    const std::string & value )
```

Adds a given tuple to this->environmentVariables.

Makes sure that neither the key nor the value is empty and then adds a tuple with both values to the environment↔  
Variables attribute

#### Parameters

<i>name</i>	The name of the env variable
<i>value</i>	The value of the env variable

#### Exceptions

<a href="#">exceptions::InvalidValueException</a>	
---	--

Definition at line 66 of file [FileData.cpp](#).

References [environmentVariables](#).

### 10.5.2.3 addPathValue()

```
void parsing::FileData::addPathValue (
```

```
const std::string & pathValue )
```

Add's a given value to this->pathValues.

Makes sure that the given value is not empty and then assigns it to the given pathValues attribute

#### Parameters

<i>pathValue</i>	The value to be added
------------------	-----------------------

#### Exceptions

<a href="#">exceptions::InvalidValueException</a>	
---	--

Definition at line 83 of file [FileData.cpp](#).

References [pathValues](#).

#### 10.5.2.4 getApplication()

```
const std::optional< std::string > & parsing::FileData::getApplication ( ) const [inline]
```

Getter for this->application.

#### Returns

The assigned application

Definition at line 120 of file [FileData.hpp](#).

References [application](#).

#### 10.5.2.5 getCommands()

```
const std::vector< std::string > & parsing::FileData::getCommands ( ) const [inline]
```

Getter for this->commands.

#### Returns

The vector of assigned commands

Definition at line 128 of file [FileData.hpp](#).

References [commands](#).

#### 10.5.2.6 `getEnvironmentVariables()`

```
const std::vector< std::tuple< std::string, std::string > > & parsing::FileData::getEnvironmentVariables ( ) const [inline]
```

Getter for this->environmentVariables.

##### Returns

The vector of assigned env variables

Definition at line 137 of file [FileData.hpp](#).

References [environmentVariables](#).

#### 10.5.2.7 `getHideShell()`

```
bool parsing::FileData::getHideShell ( ) const [inline]
```

Getter for this->hideShell.

##### Returns

The assigned value for hideshow

Definition at line 112 of file [FileData.hpp](#).

References [hideShell](#).

#### 10.5.2.8 `getOutputFile()`

```
const std::string & parsing::FileData::getOutputFile ( ) const [inline]
```

Getter for this->outputfile.

##### Returns

The assigned outputfile

Definition at line 104 of file [FileData.hpp](#).

References [outputfile](#).

#### 10.5.2.9 `getPathValues()`

```
const std::vector< std::string > & parsing::FileData::getPathValues ( ) const [inline]
```

Getter for this->pathValues.

##### Returns

The vector of assigned pathValues

Definition at line 145 of file [FileData.hpp](#).

References [pathValues](#).

#### 10.5.2.10 `setApplication()`

```
void parsing::FileData::setApplication (
    const std::string & newApplication )
```

Setter for this->application.

Set's the application attribute. Return's if the given string is empty.

## Parameters

<i>newApplication</i>	The application to be set
-----------------------	---------------------------

Definition at line 44 of file [FileData.cpp](#).

References [application](#).

### 10.5.2.11 setHideShell()

```
void parsing::FileData::setHideShell (
    bool newHideShell ) [inline]
```

Setter for this->hideshell.

## Parameters

<i>newHideShell</i>	The hideshell value to be set
---------------------	-------------------------------

Definition at line 48 of file [FileData.hpp](#).

References [hideShell](#).

### 10.5.2.12 setOutputFile()

```
void parsing::FileData::setOutputFile (
    std::string & newOutputfile )
```

Setter for this->outputfile.

Checks that neither the given string is empty, nor that the outputfile is already set and then assigns the newOutputfile to the instance.

## Parameters

<i>newOutputfile</i>	The outputfile to be set
----------------------	--------------------------

## Exceptions

<a href="#">exceptions::InvalidValueException</a>	
---	--

Definition at line 17 of file [FileData.cpp](#).

References [outputfile](#).

## 10.5.3 Member Data Documentation

### 10.5.3.1 application

```
std::optional<std::string> parsing::FileData::application [private]
```

Definition at line 152 of file [FileData.hpp](#).

#### 10.5.3.2 commands

*Assigns an command to this->data.*
- void [assignEnvironmentVariable](#) (const Json::Value &entry) const  
*Assigns an environmentVariable to this->data.*
- void [assignPathValue](#) (const Json::Value &entry) const  
*Assigns a path value to this->data.*
- std::shared\_ptr< [FileData](#) > [createFileData](#) ()  
*Creates the [FileData](#) instance.*

### Static Private Member Functions

- static std::shared\_ptr< Json::Value > [parseFile](#) (const std::string &filename)  
*Parses the given json file.*

### Private Attributes

- std::shared\_ptr< Json::Value > [root](#)
- std::shared\_ptr< [FileData](#) > [data](#)

## 10.10.1 Detailed Description

This file reads all data from the json file.

This file uses the jsoncpp library to parse all data from a json file, validate it to some degree.

See also

<https://github.com/open-source-parsers/jsoncpp>

Definition at line 45 of file [JsonHandler.hpp](#).

## 10.10.2 Constructor & Destructor Documentation

### 10.10.2.1 JsonHandler() [1/2]

```
parsing::JsonHandler::JsonHandler ( ) [inline]
```

Constructor without arguments.

This constructor can be used to initialise an instance in an outer scope and then assign it values from an inner scope.

Definition at line 53 of file [JsonHandler.hpp](#).

### 10.10.2.2 JsonHandler() [2/2]

```
parsing::JsonHandler::JsonHandler (
    const std::string & filename ) [explicit]
```

The constructor.

This constructor calls this->[parseFile\(\)](#) when called.

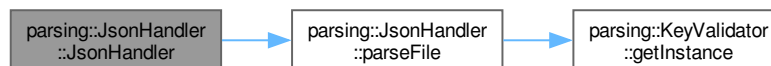

#### Parameters

<i>filename</i>	Name of the json file
-----------------	-----------------------

Definition at line 20 of file [JsonHandler.cpp](#).

References [parseFile\(\)](#), and [root](#).

Here is the call graph for this function:

## 10.10.3 Member Function Documentation

### 10.10.3.1 assignApplication()

```
void parsing::JsonHandler::assignApplication ( ) const [private]
```

Assigns application to this->data.

Retrieves the value of the application key from `Json::Value` this->root and defaults to an empty string.

Definition at line 81 of file [JsonHandler.cpp](#).

References [data](#), and [root](#).

Here is the caller graph for this function:

### 10.10.3.2 assignCommand()

```
void parsing::JsonHandler::assignCommand (
    const Json::Value & entry ) const [private]
```

Assigns an command to this->data.

## Parameters

<i>entry</i>	The entry with the command
--------------	----------------------------

Definition at line 111 of file [JsonHandler.cpp](#).

References [data](#).

Here is the caller graph for this function:

### 10.10.3.3 assignEntries()

```
void parsing::JsonHandler::assignEntries ( ) const [private]
```

Assigns entries to this->data.

Goes through each of the entries from `Json::Value this->root` and calls the relevant method depending on it's type. All "type" keys should be valid by this point.

## Parameters

<i>entry</i>	<code>Json::Value</code> containing an array with entries
--------------	---

## Exceptions

<a href="#"><code>exceptions::UnreachableCodeException</code></a>	
---	--

Definition at line 87 of file [JsonHandler.cpp](#).

References [assignCommand\(\)](#), [assignEnvironmentVariable\(\)](#), [assignPathValue\(\)](#), and [root](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 10.10.3.4 assignEnvironmentVariable()

```
void parsing::JsonHandler::assignEnvironmentVariable (
    const Json::Value & entry ) const [private]
```

Assigns an environmentVariable to this->data.

##### Parameters

<i>entry</i>	The entry with the environmentVariable
--------------	--

Definition at line 117 of file [JsonHandler.cpp](#).

References [data](#).

Here is the caller graph for this function:

### 10.10.3.5 assignHideShell()

```
void parsing::JsonHandler::assignHideShell ( ) const [private]
```

Assigns the hideshow value to this->data.

Retrieves the value of the hideshow key from Json::Value this->root and defaults to negative.

Definition at line 74 of file [JsonHandler.cpp](#).

References [data](#), and [root](#).

Here is the caller graph for this function:

### 10.10.3.6 assignOutputFile()

```
void parsing::JsonHandler::assignOutputFile ( ) const [private]
```

Assigns the outputfile to this->data.

Retrieves the outputfile from Json::Value this->root and makes sure, that the file doesn't already exist.

#### Exceptions

<a href="#">exceptions::FileExistsException</a>
---

Definition at line 63 of file [JsonHandler.cpp](#).

References [utilities::Utils::checkIfFileExists\(\)](#), [data](#), and [root](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 10.10.3.7 assignPathValue()

```
void parsing::JsonHandler::assignPathValue (
    const Json::Value & entry ) const [private]
```

Assigns a path value to this->data.

#### Parameters

<i>entry</i>	The entry with the path value
--------------	-------------------------------

Definition at line 124 of file [JsonHandler.cpp](#).

References [data](#).

Here is the caller graph for this function:

### 10.10.3.8 createFileData()

```
std::shared_ptr< FileData > parsing::JsonHandler::createFileData ( ) [private]
```

Creates the [FileData](#) instance.

Instantiates the [FileData](#) instance, calls all nessecary functions and returns a shared pointer to it.

#### Returns

Pointer to the created instance of [FileData](#)

Definition at line 53 of file [JsonHandler.cpp](#).

References [assignApplication\(\)](#), [assignEntries\(\)](#), [assignHideShell\(\)](#), [assignOutputFile\(\)](#), and [data](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 10.10.3.9 getFileData()

```
std::shared_ptr< FileData > parsing::JsonHandler::getFileData ( )
```

Retrieve the data from the json file.

This method calls this->`createFileData()` needed to retrieve the values from the `Json::Value` this->`root` and then returns a shared pointer to the created `FileData` object.

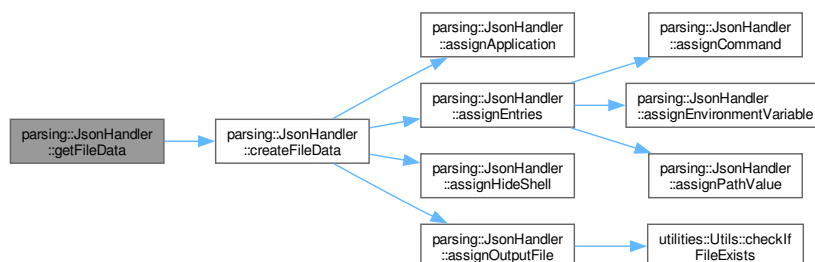

#### Returns

Pointer to the `FileData` Object with the parsed data from json

Definition at line 48 of file `JsonHandler.cpp`.

References `createFileData()`.

Here is the call graph for this function:

Here is the caller graph for this function:

### 10.10.3.10 parseFile()

```
std::shared_ptr< Json::Value > parsing::JsonHandler::parseFile (
    const std::string & filename ) [static], [private]
```

Parses the given json file.

This method first creates a new `Json::Value` instance and then tries to parse the given json file. It then validates the keys of the instance using the [KeyValidator](#) class.

#### Parameters

<i>filename</i>	The name of the file wich should be parsed
-----------------	--

#### Returns

A shared pointer to the `Json::Value` instance

#### See also

[KeyValidator::validateKeys\(\)](#)

#### Exceptions

<a href="#">exceptions::ParsingException</a>	
<a href="#">exceptions::InvalidKeyException</a>	

Definition at line 25 of file [JsonHandler.cpp](#).

References [parsing::KeyValidator::getInstance\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

## 10.10.4 Member Data Documentation

### 10.10.4.1 data

```
std::shared_ptr<FileData> parsing::JsonHandler::data [private]
```

Definition at line 153 of file [JsonHandler.hpp](#).

### 10.10.4.2 root

```
std::shared_ptr<Json::Value> parsing::JsonHandler::root [private]
```

Definition at line 152 of file [JsonHandler.hpp](#).

The documentation for this class was generated from the following files:

- [src/include/JsonHandler.hpp](#)
- [src/sources/JsonHandler.cpp](#)

## 10.11 parsing::KeyValidator Class Reference

Validates keys of a `Json::Value` object.

```
#include <KeyValidator.hpp>
```

## Public Member Functions

- `std::vector< std::tuple< int, std::string > > validateKeys` (const Json::Value &root, const std::string &filename)

*Validate keys off a Json::Value object.*

## Static Public Member Functions

- static `KeyValidator & getInstance` ()

*Get the instance of this class.*

## Private Member Functions

- `std::vector< std::tuple< int, std::string > > getWrongKeys` (const Json::Value &root, const std::string &filename)

*Retrieve the wrong keys from a Json::Value object.*

- `std::vector< std::tuple< int, std::string > > validateEntries` (const std::string &filename, const std::vector< std::string > &entryKeys)

*Validates that an entries 'type' key is valid.*

## Static Private Member Functions

- static void `validateTypes` (const std::string &filename, const Json::Value &entry, std::vector< std::string > &entryKeys)

*Validates types from the entries array.*

- static `std::optional< int > getUnknownKeyLine` (const std::string &filename, const std::string &wrongKey)

## Private Attributes

- `std::vector< std::string > validKeys`
- `std::vector< std::string > validEntryKeys`

### 10.11.1 Detailed Description

Validates keys of a Json::Value object.

This class is singleton. That way when multiple files are parsed with the application, the validKeys and validEntryKeys field only have to be allocated once.

Definition at line 26 of file [KeyValidator.hpp](#).

## 10.11.2 Member Function Documentation

### 10.11.2.1 getInstance()

`KeyValidator` & `parsing::KeyValidator::getInstance ( ) [static]`

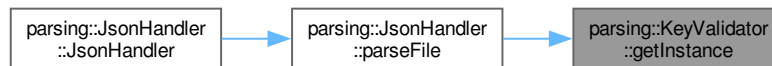

Get the instance of this class.

#### Returns

Reference to the instance of this class

Definition at line 19 of file `KeyValidator.cpp`.

Here is the caller graph for this function:

### 10.11.2.2 getUnknownKeyLine()

```
std::optional< int > parsing::KeyValidator::getUnknownKeyLine (
    const std::string & filename,
    const std::string & wrongKey ) [static], [private]
```

#### Parameters

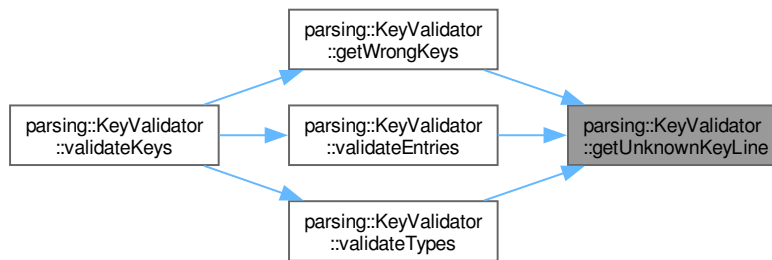

<i>filename</i>	
<i>wrongKey</i>	

#### Returns

**Todo** Documentation

Definition at line 151 of file `KeyValidator.cpp`.

Here is the caller graph for this function:

### 10.11.2.3 getWrongKeys()

```
std::vector< std::tuple< int, std::string > > parsing::KeyValidator::getWrongKeys (
    const Json::Value & root,
    const std::string & filename ) [private]
```

Retrieve the wrong keys from a `Json::Value` object.

This method goes through each key of the `Json::Value` object and makes sure it's valid.

#### Parameters

<i>root</i>	The <code>Json::Value</code> object to be validated.
<i>filename</i>	The filename from which 'root' is from.

#### Returns

A vector with tuples, containing the line and name of invalid types.

Definition at line 53 of file [KeyValidator.cpp](#).

References [getUnknownKeyLine\(\)](#), and [validKeys](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 10.11.2.4 validateEntries()

```
std::vector< std::tuple< int, std::string > > parsing::KeyValidator::validateEntries (
    const std::string & filename,
    const std::vector< std::string > & entryKeys ) [private]
```

Validates that an entries 'type' key is valid.

##### Parameters

<i>filename</i>	
<i>entryKeys</i>	

##### Returns

**Todo** Documentation

Definition at line 80 of file [KeyValidator.cpp](#).

References [getUnknownKeyLine\(\)](#), and [validEntryKeys](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 10.11.2.5 validateKeys()

```
std::vector< std::tuple< int, std::string > > parsing::KeyValidator::validateKeys (
    const Json::Value & root,
    const std::string & filename )
```

Validate keys off a `Json::Value` object.

This method goes through the `MemberNames` of a `Json::Value` object and validates, that they are part of the valid Key attribute. It calls the nessecary methods to validate the keys within the entries array.

#### Parameters

<i>root</i>	The <code>Json::Value</code> object to be validated.
<i>filename</i>	The filename from which 'root' is from.

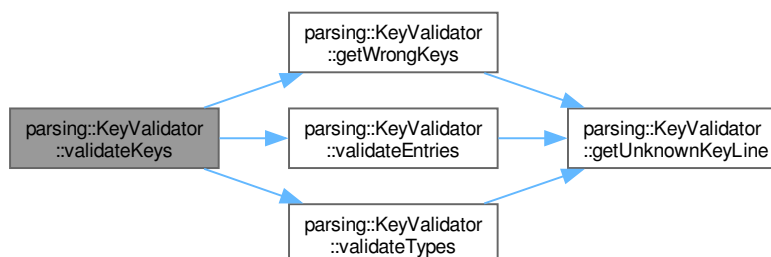

#### Returns

A vector with tuples, containing the line and name of invalid types.

Definition at line 25 of file [KeyValidator.cpp](#).

References [getWrongKeys\(\)](#), [validateEntries\(\)](#), and [validateTypes\(\)](#).

Here is the call graph for this function:

### 10.11.2.6 validateTypes()

```
void parsing::KeyValidator::validateTypes (
    const std::string & filename,
    const Json::Value & entry,
    std::vector< std::string > & entryKeys ) [static], [private]
```

Validates types from the entries array.

Makes sure that each type has it's according keys, needed to parse it.

#### Parameters

<i>filename</i>	The filename from which 'entry' is from
<i>entry</i>	
<i>entryKeys</i>	

Definition at line 106 of file [KeyValidator.cpp](#).

References [getUnknownKeyLine\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

## 10.11.3 Member Data Documentation

### 10.11.3.1 validEntryKeys

```
std::vector<std::string> parsing::KeyValidator::validEntryKeys [private]
```

#### Initial value:

```
= { "type", "key", "value", "path",
    "command"
}
```

Definition at line 111 of file [KeyValidator.hpp](#).

### 10.11.3.2 validKeys

```
std::vector<std::string> parsing::KeyValidator::validKeys [private]
```

**Initial value:**

```
= {"outputfile", "hideshell", "entries",  
  "application"  
}
```

Definition at line 108 of file [KeyValidator.hpp](#).

The documentation for this class was generated from the following files:

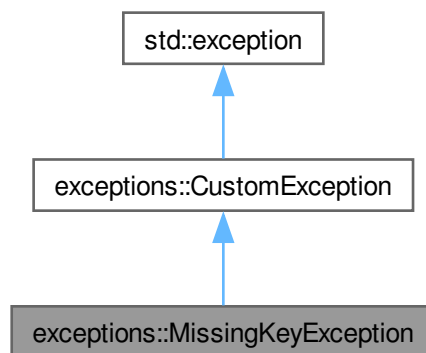

- [src/include/KeyValidator.hpp](#)
- [src/sources/KeyValidator.cpp](#)

## 10.12 exceptions::MissingKeyException Class Reference

Exception for missing keys within entries.

```
#include <Exceptions.hpp>
```

Inheritance diagram for exceptions::MissingKeyException:

Collaboration diagram for exceptions::MissingKeyException:

### Public Member Functions

- [MissingKeyException](#) (const std::string &[key](#), const std::string &[type](#))
- const char \* [what](#) () const noexcept override

### Public Member Functions inherited from [exceptions::CustomException](#)

- const char \* [what](#) () const noexcept override

### Private Attributes

- std::string [message](#)
- std::string [type](#)
- std::string [key](#)

## 10.12.1 Detailed Description

Exception for missing keys within entries.

This exception is thrown when a key (such as "path" or "command") is missing from an entry. It also prints the type and which key it is missing.

Definition at line [184](#) of file [Exceptions.hpp](#).

## 10.12.2 Constructor & Destructor Documentation

### 10.12.2.1 MissingKeyException()

```
exceptions::MissingKeyException::MissingKeyException (
    const std::string & key,
    const std::string & type ) [inline]
```

#### Note

I planned to use `std::format`, however it seems that the required Compiler Version is not yet available in the stable Ubuntu Repo!

Definition at line 191 of file [Exceptions.hpp](#).

References [key](#), [message](#), and [type](#).

## 10.12.3 Member Function Documentation

### 10.12.3.1 what()

```
const char * exceptions::MissingKeyException::what ( ) const [inline], [override], [noexcept]
```

Definition at line 203 of file [Exceptions.hpp](#).

References [message](#).

## 10.12.4 Member Data Documentation

### 10.12.4.1 key

```
std::string exceptions::MissingKeyException::key [private]
```

Definition at line 188 of file [Exceptions.hpp](#).

### 10.12.4.2 message

```
std::string exceptions::MissingKeyException::message [private]
```

Definition at line 186 of file [Exceptions.hpp](#).

### 10.12.4.3 type

```
std::string exceptions::MissingKeyException::type [private]
```

Definition at line 187 of file [Exceptions.hpp](#).

The documentation for this class was generated from the following file:

- [src/include/Exceptions.hpp](#)

## 10.13 exceptions::MissingTypeException Class Reference

Exception for missing types of entries.

```
#include <Exceptions.hpp>
```

Inheritance diagram for exceptions::MissingTypeException:

Collaboration diagram for exceptions::MissingTypeException:

### Public Member Functions

- [MissingTypeException](#) ()
- `const char * what () const` noexcept override

## Public Member Functions inherited from [exceptions::CustomException](#)

- `const char * what () const` noexcept override

## Private Attributes

- `std::string message = "Missing \"type\" key for at least one entry!"`

### 10.13.1 Detailed Description

Exception for missing types of entries.

This exception is thrown, when an entry is missing it's "type" key.

Definition at line 214 of file [Exceptions.hpp](#).

### 10.13.2 Constructor & Destructor Documentation

#### 10.13.2.1 MissingTypeException()

## 10.17 utilities::Utils Class Reference

Responsible for utility function.

```
#include <Utils.hpp>
```

### Static Public Member Functions

- static void [setupEasyLogging](#) (const std::string &configFile)  
*Set up easylogging.*
- static bool [checkIfFileExists](#) (const std::string &fileName)  
*Check if a file exists.*
- static bool [checkFileEnding](#) (const std::string\_view &fileName)  
*Checks if the file ending is ".json".*
- static bool [askToContinue](#) (const std::string &prompt="Do you want to continue? (Y/N)\n")  
*Asks if the user wants to continue.*

#### 10.17.1 Detailed Description

Responsible for utility function.

This class is responsible for handling miscellaneous utility functions which be used throughout the whole project.

Definition at line 39 of file [Utils.hpp](#).

### 10.17.2 Member Function Documentation

#### 10.17.2.1 askToContinue()

```
bool utilities::Utils::askToContinue (
    const std::string & prompt = "Do you want to continue? (Y/N)\n" ) [static]
```

Asks if the user wants to continue.

Asks the user if they want to continue and prompts them for a response.

**Parameters**

<i>prompt</i>	(Optional) A custom prompt to be used.
---------------	--

**Returns**

Returns true if the user wants to continue and false otherwise.

Definition at line 40 of file [Utils.cpp](#).

Here is the caller graph for this function:

**10.17.2.2 checkFileEnding()**

```
bool utilities::Utils::checkFileEnding (
    const std::string_view & fileName ) [static]
```

Checks if the file ending is ".json".

This function checks if the given file ends with ".json".

**Parameters**

<i>fileName</i>	The file which should be checked.
-----------------	-----------------------------------

**Returns**

Returns true if the file ends with ".json" and false otherwise.

Definition at line 37 of file [Utils.cpp](#).

Here is the caller graph for this function:

**10.17.2.3 checkIfFileExists()**

```
bool utilities::Utils::checkIfFileExists (
    const std::string & fileName ) [static]
```

Check if a file exists.

This function checks if a file exists by trying to open it using fstream.

**Parameters**

<i>fileName</i>	The file which should be checked.
-----------------	-----------------------------------

**Returns**

Returns true if the file exists and false otherwise

Definition at line 32 of file [Utils.cpp](#).

Here is the caller graph for this function:

**10.17.2.4 setupEasyLogging()**

```
void utilities::Utils::setupEasyLogging (
    const std::string & configFile ) [static]
```

Set up easylogging.

This function sets up the easylogging library based on the given config file.

## Parameters

<i>configFile</i>	The config file which is used
-------------------	-------------------------------

Definition at line 24 of file [Utils.cpp](#).

References [HOMEPAGE\\_URL](#), [MAJOR\\_VERSION](#), [MINOR\\_VERSION](#), [PATCH\\_VERSION](#), and [PROJECT\\_NAME](#).

#include "config.hpp"
```

Include dependency graph for main.cpp:

## Functions

- INITIALIZE\_EASYLOGGINGPP std::vector< std::string > [validateFiles](#) (std::vector< std::string > files)
- void [parseFiles](#) (std::vector< std::string > files)
- int [main](#) (int argc, char \*argv[ ])

*Main function of the program.*

### 11.18.1 Detailed Description

Contains the main function.

#### Author

Elena Schwarzbach, Max Rodler, Simon Blum, Sonia Sinaci

#### Date

2024-04-18

#### Version

0.1.5

The main function is responsible for connection all parts of the programm. It calls all relevant classes and finishes when everything is done.

#### Copyright

See LICENSE file

Definition in file [main.cpp](#).

## 11.18.2 Function Documentation

### 11.18.2.1 main()

```
int main (
    int argc,
    char * argv[] )
```

Main function of the program.

The main function is responsible for connection all parts of the programm. It calls all relevant classes and finishes when everything is done.

#### Parameters

<i>argc</i>	The number of arguments given
<i>argv</i>	Th command line arguments given

#### Returns

Returns 0 on success, 1 on failure
